ABSTRACT
Hypertension is a major cardiovascular problem resulting in significant mortality. Cissus quadrangularis having several pharmacological effects has not been evaluated for its ability to modulate blood pressure. Thus, the ability of C. quadrangularis aqueous extract (CQE) to modulate blood pressure was evaluated in normotensive and angiotensin II-induced hypertensive rats under urethane anesthesia. The animals were divided into four groups namely, control (saline injection), CQE (extract alone, 10 mg/kg), Ang II (Ang II alone, 0.5 µg/kg) and Ang II + CQE (Ang II + extract). All treatments were delivered by intravenous route and in Ang II + CQE group, Ang II was injected 30 min after injection of the extract. Hemodynamic parameters, systolic blood pressure (SBP), diastolic blood pressure (DBP), mean arterial blood pressure (MABP), and heart rate (HR) were recorded by the BIOPAC system after the cannulation of the carotid artery and jugular vein. The results indicated that CQE lowered SBP, DBP, MABP and heart rate to varying degrees in normotensive rats compared to control groups. In case of angiotensin II-induced hypertension, CQE administration resulted in substantial decrease in SBP, DBP, and MABP which were raised by Ang II. CQE reduced SBP, DBP, and MABP by 12, 59, and 11%, respectively. It is worth noting that, while SBP was not brought down to baseline levels by CQE, DBP was, suggesting significant hypotensive/antihypertensive activity of CQE. Further research is required to determine the molecular mechanism of C. quadrangularis extract’s hypotensive/antihypertensive action and to conduct clinical trials to establish its optimal use as an antihypertensive therapeutic.

KEY WORDS: ANTIHYPERTENSIVE, AT1, AT2, HADJOD, HYPOTENSIVE.

INTRODUCTION
Hypertension is a major cause of death from cardiovascular complications such stroke, chronic kidney disease, and congestive heart disease. Despite many pharmacotherapies and lifestyle changes, the treatment of hypertension is still being investigated and remains difficult, with blood pressure not remaining at a normal level in around half of hypertensive patients. Alternatively, researchers have led concerted efforts to explore novel therapeutics with hypotensive/anti-hypertensive properties from medicinal plants/herbs. As an outcome, some of these medicinal plants with acclaimed hypotensive/antihypertensive properties have been validated, while others have been dismissed (Etuk 2006; Al-Anbaki et al. 2021; Azizah et al. 2021; Verma et al. 2021). Cissus quadrangularis Linn. (Vitaceae), often known as "bone setter" in Ayurvedic medicine owing to its bone fracture healing properties, is a tropical perennial plant found in India, Sri Lanka, Malaysia, Java, and West Africa. It is a perennial climber with four wings internodes and a slender, fleshy fibrous, smooth stem (Sundaran et al. 2020; Kaur et al. 2021). Aside from being used as a vegetable in India, it is also used as a folkloric medicine.
to treat menstruation irregularities, dyspepsia, flatulence, colic, convulsions, asthma, inflammation, infections, and obesity. A number of bioactive compounds, including flavonoids (quercetin, kaempferol, daidzein, and genistein), triterpenoids (friedelin, β-amyrin and 7-oxo-onocer-8-ene-3 β 21-α diol), stilbene derivatives (quadrangularin A, quadrangularin B, quadrangularin C, resveratrol piceatannol, pallidol, and parthenocissus), iridoids (6-O-[2,3-dimethoxy]-trans-cinnamoyl catalpol and 6-O-meta-methoxy-benzoyl catalpol, picroside and pallidol), phytosterols (β-sitosterol, β-sitosterol-O-b-D-glucoside and ketosetosterol), phenolic compounds and tannins have been isolated from the aerial parts of *C. quadrangularis* (Shah 2011; Sundaran et al. 2020; Zaki et al. 2020; Bafna et al. 2021; Kaur et al. 2021).

Various extracts and formulations of *C. quadrangularis* have been attributed with potential pharmacological effects including anti-osteoporotic, anti-obesity, antioxidant, anti-diabetic, anti-nociceptive, anti-ulcer, analgesic and anti-inflammatory effects (Murthy et al. 2003; Shirwaikar et al. 2003; Jainu and Devi 2004; Jainu and Devi 2006a; Jainu and Devi 2006b; Oben et al. 2006; Rao et al. 2007; Mate et al. 2008; Lekshmi et al. 2015; Jain et al. 2020; Bafna et al. 2021; Kaur et al. 2021). Despite the fact that researchers have investigated into several pharmacological effects of *C. quadrangularis*, some of which have even entered clinical trials, its potential use against hypertension has yet to be revealed. Thus, the potential of *C. quadrangularis* aqueous extract to modulate blood pressure and heart rate in urethane-anesthetized rats was investigated against angiotensin II-induced hypertension.

### MATERIAL AND METHODS

*C. quadrangularis* aerial parts were collected from Mysore region in India, subsequently identified by Dr. Sharanappa and a reference specimen was retained in the laboratory. Normal saline, heparin and adrenaline were purchased from local pharmacy. Angiotensin II and urethane was procured from Sigma Aldrich, USA. All of the other chemicals and reagents used in the analysis were of the finest analytical purity. The sample was washed with running water to eliminate dirt before being spread out on large trays. The trays were placed in a shady area for 12 hours before being chopped into small pieces. The chopped pieces were then dried for 24 hours in a hot air oven set at 60°C. In a cyclonic laboratory blender, the dry material was pulverized until it passed through a 60-mesh screen. The powder was kept in an airtight container in the refrigerator for subsequent use. *C. quadrangularis* extract (CQE) was prepared by mixing the powder with hot distilled water at 70°C (1:8 w/v) and extracting it using a mechanical shaker for 24 hours. The extract was then filtered, and the residue was re-extracted with hot water for 12 hours before being filtered again. Both filtrates were pooled and evaporated in a flash evaporator set at 60°C to yield CQE, which was stored in an airtight container in the refrigerator for future use.

The hypotensive/antihypertensive activity of *C. quadrangularis* extract was evaluated using the procedure reported by Mohebbati et al. (2020) with some modifications. An intraperitoneal injection of urethane (1.25 g/kg) was used to anesthetize the animals. The rat’s necks and inguinal regions were shaved using an electric shaver after the anaesthesia was confirmed. The jugular vein was surgically cannulated for medication delivery, while the left carotid artery got PE-50 tubing cannula to record cardiovascular data. The arterial cannula was connected to a blood pressure transducer (SS13L) and the venous cannula to a syringe using a three-way plastic stop cock and a stainless-steel needle at the end of the PE tubing. Before cannulation, both cannulae were prefilled with heparinized saline. Systolic blood pressure (SBP), diastolic blood pressure (DBP), mean arterial blood pressure (MABP), and heart rate (HR) were all constantly monitored by the system (BIOPAC Systems).
Antihypertensive medicinal herbs usually modulate RAS by inhibiting angiotensin converting enzyme (ACE) activity or by modulating angiotensin II levels by inhibiting binding to AT1 and AT2 receptors (Mohebbati et al. 2020). Some investigations have found that antioxidant flavonoids like quercetin, triterpenes, anthocyanins and proanthocyanidins suppress RAS via reducing ACE and Ang II binding. As a result, natural products containing antioxidant compounds are thought to be beneficial against hypertension (Parichatikanond et al. 2012; Mohebbati et al. 2020). Various extracts of *C. quadrangularis* have been found to be efficient free radical quenchers, including nitric oxide (NO), superoxide anion, singlet oxygen, and hydroxyl radicals produced by the human body’s cells as a result of oxygen utilization (Murthy et al. 2003; Dhanasekaran 2020; Jain et al. 2020; Bafna et al. 2021; Kaur et al. 2021). These extracts have been shown to contain a wide range of chemical compounds, including flavonoids (quercetin, kaempferol, daidzein, and genistein), triterpenoids (friedelin, β-amyrin and 7-oxo-onor-8-ene-3β 21-α diol), stilbene derivatives (quadrangularin A, quadrangularin B, quadrangularin C, resveratrol piceatannol, pallidol, and parthenocissus), iridoids (6-O-[2,3-dimethoxy]-trans-cinnamoyl catalpol and 6-O-[meta-methoxy-benzoyl catalpol, picroside and pallidol), phytoesters (β-sitosterol, β-sitosterol-O-b-D-glucoside and ketosetosterol), phenolic compounds and tannins, the majority of which have been associated with significant antioxidant and antihypertensive activities (Amarowicz 2007; Wang et al. 2007; Frombaum et al. 2012; Rodrigo et al. 2012; Kucharska et al. 2017). As a reason, the hypotensive/antihypertensive effect of CQE can be attributed to the antioxidant compounds' blocking of angiotensin II binding to angiotensin receptors.

**CONCLUSION**

The findings of the present study revealed that *C. quadrangularis* aqueous extract had strong hypotensive potential in normotensive rats and antihypertensive effect in angiotensin II-induced hypertension in urethane-anesthetized rats. Further research is required to determine the molecular mechanism of *C. quadrangularis*’ hypotensive/antihypertensive action and to conduct clinical trials to establish its optimal use as an antihypertensive therapeutic.
