Bioscience Biotechnology Research Communications

Open Access International Journal

About Us

Biosc Biotech Res Comm is an official publication of an academic, non-profit Society for Science and Nature, Bhopal India, since 2008. It is a peer reviewed journal that publishes original research articles pertaining to exciting applied areas of biology including biomedical sciences. The aim of *Biosc Biotech Res Comm* is to promote quality scientific research in fundamental and applied areas of biological and biomedical sciences and their allied branches.

It publishes scholarly articles demonstrating academic quality and scientific rigor for disseminating current scientific information on research and development for human welfare. *Biosc Biotech Res Com*m audiences its large number of readers from diverse regions of Asia, Africa, Europe and other developing nations across the world. It is an open access means of scientific communication, that provides contribution to the existing knowledge as well as envisages scientific temper specially in the young minds, pursuing science as a career.

Articles aimed for publication in Biosc Biotech Res Comm must have new experimental methods of biotechnological significance, novel laboratory obtained results, interesting interpretation of data pertaining to providing practical solutions to human-welfare problems of substantial scientific significance. The publishers of *Biosc Biotech Res Comm* believe in best of publication standards, hence a single journal is being published by them since 2008, to focus on its high academic standards, selecting quality papers for a timely schedule of publication. *Biosc Biotech Res Comm* strives hard to maintain high quality and follows best practices of publication, particularly in prioritizing originality and quality, hence it has a tough rate of article selection. Less than 50 percent of submitted manuscripts are accepted, and reluctantly, a large number of articles are returned by us.

Articles are selected for possible publication, keeping in view the novelty of the work, originality (plagiarism / similarity levels are checked), word count, explicit English language using quality writing, lucid presentation and interpretation of data, along with conclusive data based statements showing contribution to the existing knowledge. Before final acceptance each article undergoes several rounds of unbiased anonymized revisions, strictly complying the reviewers comments and their satisfaction.

Biosc Biotech Res Comm categorizes articles into exciting analytical systematic data based reviews, novel case reports, original research articles, rapid communications and letters to the editor, including lively correspondence and perspectives. Each type of article has a special format and should strictly comply with the up-dated instructions for authors, which are published in all issues of *Biosc Biotech Res Comm* as well as are on the official website of the journal.

Aims and Scope

Biosc Biotech Res Comm is an open access means of scientific communication that provides contribution to the existing knowledge as well as envisages scientific temper in the young minds, pursuing science as a career. It publishes scholarly articles following scientific rigor for disseminating current information on research and development in applied biology and biomedical sciences. Articles may include new experimental methods of bio-medical significance, new laboratory obtained results, novel interpretation of existing data pertaining to providing practical solutions to human welfare problems of substantial scientific significance.

Biosc Biotech Res Comm has a special task of helping researchers from developing countries to present their cherished fruits of research grown on toiled and tilled trees of hard work. Such scholars are encouraged with significant waivers in publication charges. All articles under submission to Biosc Biotech Res Comm should aim for the development of technological concepts, rather than merely recording the facts, showing evidence of scholarly publication.

Articles submitted to Biosc Biotech Res Comm are evaluated according to their intellectual merit, without regard to the race, gender, sexual orientation, religious beliefs, ethnic origin, citizenship, political philosophy, or institutional affiliation of the author (s).Editorial decisions on manuscripts submitted to our journal are based on independent, anonymized peer review reports. The journal is committed to an editorial process that is not compromised by financial or political influence, thereby actively seeking and encouraging submissions from underrepresented segments of the global scholarly communication ecosystem.

Incomplete studies and manuscripts not in strict compliance with the journals policies will be strongly discouraged and rejected. Each type of article has a special format and should comply with the updated Biosc Biotech Res Comm Instructions for authors / submission check List, published in its issues. We are particular in demonstrating conformance with established industry guidelines and best practices promoted by professional scholarly publishing organizations such as: Committee on Publication Ethics (COPE) and Principles of Transparency and Best Practice in Scholarly Publishing.

Biosc Biotech Res Comm strives hard to promote quality scientific research in fundamental and applied areas of biotechnology, bioscience and biomedical sciences via interactive communication among biologists, biotechnologists, health science personnel and biomedical experts from Asia and other regions of the world. It audiences its large number of authors from diverse regions such as Europe, Asia, South East Asia, Russian Federation, the Asia Pacific including several developing nations, because of its quality and timely schedule of publication. The journal is read by a large community of scholars, scientists and students from many continents

Journal Polices of Bioscience Biotechnology Research Communications

(Author Ethical Statement / Copyright forms / Plagiarism Check Report)

Authors

Authors are specifically those who have made:

Substantial contributions to the conception or design of the work; or the acquisition, analysis, or interpretation of data for the work; and / or drafting the work or revising it critically for important intellectual content; and / or final approval of the version to be published.

The corresponding author's specific responsibilities include:

- Manuscript correction and proof reading. Handling the revisions and re-submission of revised manuscripts up to the acceptance of the manuscripts. Agreeing to and signing the Author Publishing Copyright / Ethical Statement/ Plagiarism Level Check Certificate Forms on behalf of relevant co-authors.
- Arranging for payment of an APC (article processing charge) where one is required. The affiliation of the corresponding author is used to determine eligibility for discounted or waived APCs under our journals Waiver Policies.
- Acting on behalf of all co-authors in responding to queries from all sources postpublication, including questions relating to publishing ethics, reuse of content, or the availability of data, materials, resources etc.
- Acknowledgments section in their publication with permission, for example to recognize the contributions of anyone who provided research or writing assistance.
- We integrate with established and emerging industry standards to increase transparency in authorship (for example, ORCID).

Author Affiliations: Any article affiliations should represent the institution(s) at which the research presented was conducted and/or supported and/or approved. For non-research content, any affiliations should represent the institution(s) with which each author is currently affiliated.

Acknowledgements of funds / grants etc received for the submitted work must be mentioned before the section of references: This work was supported by ———- Name of Agency, department / Grant number ——— Year to ——- (Name of Author (s)).

Where no specific funding has been provided for the research, we ask that corresponding authors use the following sentence: The author(s) received no financial support for the research, authorship, and / or publication of this article.

Plagiarism

Plagiarism is defined as using some ones else's ideas, words, data, or other material produced by them without acknowledgement. It is the unauthorized use or close imitation of the language and thoughts of another author and representing them as one's own original work and *Biosc Biotech Res Comm* condemns all forms of plagiarism, following a very strict and vigilant policy of removing this malady. Within the academia, it is considered dishonesty or fraud and offenders are subject to academic censure.

Plagiarism can be unintentional or intentional, reproducing academic material without appropriate credit to the original authors (Citations / References). Similarly self -plagiarism is the re-use of significant, identical or near identical portions of one's own work without citing the original work. This is also known as recycling fraud. Worst form of plagiarism is to steal the whole article from some journal and publish it under one's own name in another journal.

Plagiarism, fabrication, unethical or redundant publication grossly violates the editorial policies of *Biosc Biotech Res Comm.* which follows best practice guidelines given by the International Committee of Medical Journal Editors (ICMJE) and Committee on Publication Ethics (COPE), as mentioned in the Instructions for Authors *Biosc Biotech Res Comm.*

All authors submitting their MS to *Biosc Biotech Res Comm* must complete and sign the ethical statement form and append the Plagiarism Check Certificate of their MS along with copy-right form (www.bbrc.in) failing which, their MS will not be processed further.

The Editorial Committee of *Biosc Biotech Res Comm* will blacklist any author found to be guilty of plagiarism or exceeding the standard limits of similarity levels of text matter in their MS. The name of author(s) committing plagiarism or using similar text without appropriate citations will also be disseminated to concerned authorities.

We do not tolerate plagiarism in any of our publications, and we reserve the right to check all submissions through appropriate plagiarism checking tools. Submissions containing suspected plagiarism, in whole or part, will be rejected. If plagiarism is discovered post publication, we will follow our guidance outlined in the Retractions, Corrections and Expressions of Concern section of these guidelines. We expect our readers, reviewers and editors to raise any suspicions of plagiarism, either by contacting the relevant editor or by emailing at editor@bbrc.in.

Complaint Policy of Biosc.Biotech.Res.Comm

Genuine complaints in Publication: Complaint or expressionof dissatisfaction made in honest intention of improvisation are always welcome, as they provide an opportunity and instant moment of attaining quality. The editorial team of Bioscience Biotechnology Research Communications shall strive hard to establish, along with the publisher, a transparent mechanism for appeal against editorial decisions or any related matter of publication. If still there are any genuine complaints related to ethical publishing, we are always open to them for the sake of maintaining quality and ethics of publication.

Please write your complaint with Journal title, Vol No/ Issue No /Year /Page numbers, full title of the MS and necessary author details along with type of complaint. The complaint must be about something that is within the jurisdiction of Bioscience Biotechnology Research Communications, its contents or process such as authorship, plagiarism, copy right violation, multiple, duplicate, or concurrent publications/simultaneous submissions etc.Similarly, undisclosed conflicts of interest, reviewer bias or competitive harmful acts by reviewers or any bias of apparent discontentment, backed by logic and judicial discretion will be immediately looked into without any bias and discrimination.

If the Editor receives a complaint that any contribution to the Journal breaks intellectual property rights or contains material inaccuracies or otherwise unlawful materials, a detailed investigation may be requested into, with the parties involved, substantiating their materialistic claims in writing, following the law of natural justice. We assure that we will make a good faith determination to remove the allegedly wrongful material or take actions as per law. All the investigations and decisions are to be documented to the Journal.

Our aim is to ensure that Bioscience Biotechnology Research Communications follows best practices in publication and is of the highest quality, free from errors. However, we accept that occasionally mistakes might happen, which are inadvertently made or beyond human control, giving opportunity to all parties to decide the best to rectify.

Editorial Complaints Policy: The Managing Editor and staff of Bioscience Biotechnology Research Communications will make every efforts to put matters right as soon as possible in the most appropriate way, offering right of reply where necessary. As far as possible, we will investigate complaints in a blame-free manner, looking to see how systems can be improved to prevent mistakes occurring.

How to Make a Complaint: Complaints about editorial content should be made as soon as possible after publication, preferably in writing by email to editor@bbrc.in or by on-line submission at www.bbrc.in

Peer Review Policy

Unbiased, independent, critical assessment is an intrinsic part of all scholarly work, including the scientific process. Peer review is the critical assessment of manuscripts submitted to journals by experts who are not part of the editorial staff, and is, therefore, an important extension of the scientific process. Each article submitted to Biosc. Biotech. Res. Comm for publication is reviewed by at least two specialist reviewers of the concerned area. The dual review process is strictly followed and in certain controversial cases, the opinion of a 3rd reviewer can also be sought.

Manuscript Processing

Upon on-line submission of the manuscript, the author will be acknowledged with a MS number, via e-mail. Initially an article will be reviewed by the Editorial team to judge the academic quality, scientific rigor and format of the manuscript, in particular its relevance to the scope of the journal, compliance with instructions to authors check list and levels of similarity / accidental plagiarism.

Article submissions must consist of academic material that is unique and original, meaning that articles must engage cited material through critical thought. Articles must follow conventions of the English language in regard to proper grammar, punctuation, and typical writing practices. All factual statements must be supported by cited sources or research evidence. Authors must ensure the accuracy of citations, quotations, diagrams, tables, and maps.

Articles written in poor English language with confusing or illogical statements, or not conforming to instructions to authors of Biosc.Biotech.Res. Comm will either be rejected or returned to the authors for reformatting. Manuscripts deemed proper only will be forwarded to at least two subject experts to work as anonymized reviewers in a time bound frame of 4 to 5 weeks, to provide their unbiased input on the overall quality of the reviewed manuscript as per standard international norms.

Acceptable manuscripts will be checked for data analysis and verification of references before the author is notified about the status of the paper with any suggestions for modifications strictly as reviewers comments and revisions asked. Editors will check at every step for full compliance and revision of all such articles in press. Finally accepted articles will then be forwarded for typesetting and formatting, and the galley proof will be sent to the authors for proof reading, before final publication in a time bound period. For detailed process of manuscript, please see the flow chart of MS processing in Biosc.Biotech.Res.Comm.

Guidelines for Reviewers

An unpublished manuscript is a privileged document. Please protect it from any form of exploitation. Don't cite a manuscript or refer to the work it describes before it has been published and don't use the information that it contains for the advancement of your own research or in discussions with colleagues. Adopt a positive, impartial attitude toward the manuscript under review, with the aim of promoting effective and constructive scientific communication.

If you believe that you cannot judge a given article impartially, please return it immediately to the editor. Reviews must be completed within 4 to 5 weeks. If you know that you cannot finish the review within that time, immediately return the manuscript to the editor.
In your review, consider the following aspects of the manuscript: –Adherence to style of the MS as set forth in Instructions to Authors of Biosc Biotech Res Comm.

- Adequacy of title, abstract and its contents. Explicit language and clear expression of findings in the manuscript.
- Significance of objectives, questions or subjects studied, with a clear justification or rationale.
- Originality of work: It should be checked through standard plagiarism software only.
- Appropriateness of approach or methodology and adequacy of experimental techniques with citations, so that the work can be easily replicated.
- Appropriateness of clear images, figures and or tables and length of article, word count etc..
- Experimental data its lucid presentation and critical interpretation.
- Soundness of conclusion based on data, and interpretation and relevance of discussion of the manuscript.
- Appropriate literature citations as per Harvard Style of References with updated references.
- All sources must be cited in the reference list and in the main text. References with non-English titles must include a translation. All in-text citations must be cited in the reference list and all sources in the reference list must be cited within the article. Sources accessed online must include a DOI or URL.

If you wish to mark the text of the manuscript, use a pencil or make a photocopy, mark it, and return it together with the original. You can be particularly helpful in pointing out unnecessary illustrations and data that are presented in both tabular (and graphic) form and in detail in the text. Such redundancies are a waste of space and readers time.

A significant number of authors have not learnt how to organize data and will be benefit from your guidance. Do not discuss the paper with its authors. In your comments intended for transmission to the author, do not make any specific statement about the acceptability of a paper. Suggested revision should be stated as such and not expressed as conditions of acceptance. Present criticism dispassionately and avoid offensive remarks.

Organize your review so that an introductory paragraph summarizes the major findings of the article, gives your overall impression of the paper and highlights the major shortcomings. This paragraph should be followed by specific numbered comments which if appropriate may be subdivided into major and minor points. Confidential remarks directed to the editor should be typed (or handwritten) on a separate sheet, not on the review form. You might want to distinguish between revisions considered essential and those judged merely desirable.

Your criticisms, arguments and suggestions concerning the paper will be most useful to the editor and to the author if they are carefully documented. Do not make dogmatic, dismissive statements, particularly about the novelty of work. Substantiate your statements.

Reviewer's recommendations are gratefully received by the editor. However, since editorial decisions are usually based on evaluations derived from several sources, reviewers should not expect the editor to honor every recommendation.

Conflict of Interest

Conflict of interest exists when as author (or the author's institution), reviewer, or editor has financial or personal relationships that inappropriately influence (bias) his or her actions (such relationship are also known as dual commitments, competing interests, or competing loyalties). However, conflicts can also occur for other reasons, such as personal relationships, academic competition, and intellectual passion. Increasingly, individual studies receive funding from commercial firms, private foundations, and the government. The conditions of this funding have the potential to bias and otherwise discredit the research.

When authors submit a manuscript, they are required to disclose all financial and personal relationships that might bias their work. To prevent ambiguity, authors must state explicitly whether potential conflicts do or do not exist. It is the discretion of editorial committee of *Biosc BiotechRes. Comm* to resolve any conflict of interest between the author(s) and reviewers. Editors may choose not to consider an article for publication if they feel that the research is biased by the sponsors funding the research project.

Duplicate and Redundant Publication

Duplicate or redundant publication, or self-plagiarism, occurs when a work, or substantial parts of a work, is published more than once by the author (s) of the work without appropriate cross-referencing or justification for the overlap.

We expect our readers, reviewers and editors to raise any suspicions of duplicate or redundant publication, either by contacting the relevant editor or by emailing at editor@bbrc.in. When authors submit manuscripts to our journals, these manuscripts should not be under consideration, accepted for publication or in press within a different journal, book or similar entity, unless a journal is explicit that it does not have an exclusive submission policy.

Retractions

Editors will consider retractions, corrections or expressions of concern in line with COPE's Retraction Guidelines. If an author is found to have made an error, the journal will issue a corrigendum. If the journal is found to have made an error, they will issue an erratum. Retractions are usually reserved for articles that are so seriously flawed that their findings or conclusions should not be relied upon, or that contain substantial plagiarism or life-endangering content. Journals that publish Accepted Manuscripts may make minor changes such as those which would likely occur during copyediting, typesetting or proofreading, but any substantive corrections will be carried out in line with COPE's Retraction Guidelines.

Ethical Issues

1. Animal and Human Studies

Ethical declarations in research form an integral part during the submission process of a manuscript to a journal. Bioscience Biotechnology Research Communications requires that the experimental conditions under which animal and human assays and tests are performed are as per standard protocols used worldwide. Authors must make it clear in writing that the procedures they used were as humane as possible and have been compiled with the guidelines for animal care of their institutions or with national / international guidelines. Studies on animals must comply with the prevailing standards of animal welfare according to Indian Council of Medical Research Guidelines or Central Committee of Animal Ethics in India and likewise following similar conditions elsewhere, (Ethical Approval Committees/ Institutional Review Board with Approval Number is necessary). For details of animal studies please see : ARRIVE and Guide for the Care and Use of Laboratory Animals

Studies involving human subjects / patients / and also if the manuscript includes case reports / case series, authors need to provide the following: Name of the Ethical Committees /Institutional review Board, they have obtained consent from along with approval number /ID. Authors should specifically mention that the study was in accordance with the Helsinki Declaration of 1975 (Human research: Helsinki Declaration as revised in 2013).

Human Studies: Ethical Standards and Informed Consent

++For studies involving human subjects and volunteers, please indicate in the manuscript, in a section preceding the References, the following statement or an analogous statement that applies to your situation: "All procedures followed were in accordance with the ethical standards of the responsible committee on human experimentation (institutional and national) and with the Helsinki Declaration of 1975 Human research: Helsinki Declaration as revised in 2013.

Informed consent should be obtained from all patients for being included in the study." If any identifying information about participants is included in the article, the following sentence should also be included: "Additional informed consent was obtained from all individuals for whom identifying information is included in this article." If you have not included or cannot include this statement in your manuscript, please provide the reason or an alternative statement here and in the manuscript.

2. Disclosure of Interest

Authors must provide details of any financial or personal relationships that might bias the work being submitted.

In a section of text preceding the References, please provide relevant information for each author(s) with regard to any conflicts of interest. All submissions must include disclosure of all relationships that could be viewed as presenting a potential conflict of interest.

3. Acknowledgement of sources:

Proper acknowledgment of the work of others must always be given. Funding acknowledgement must be properly made with grant details, number etc.

Data access and retention: Authors may be asked to provide the raw data in connection with a paper for editorial review, and should be prepared to provide public access to such data.

Open Access Policy Statement

Bioscience Biotechnology Research Communications is an open access journal which means that all content is freely available without charge to the user or his/her institution. Users are allowed to read, download, copy, distribute, print, search, or link to the full texts of the articles, or use them for any other lawful purpose, without asking prior permission from the publisher or the author for any used content, however all freely used content must be properly cited with details. This is in accordance with the BOAI definition of open access. The full text of all content of Bioscience Biotechnology Research Communications is available for free and has open access without delay with no embargo period.

Retractions/ Corrections / Withdrawal

Submission of an article to Biosc. Biotech. Res.Comm implies that the work has NOT been published or submitted elsewhere, therefore, the journal is strongly against unethical withdrawal of an article from the publication process after submission. Once the article is submitted, it is the absolute right of the editorial board to decide on article withdrawals. For genuine withdrawal, the corresponding author should submit a request which must be signed by all co-authors explaining the explicit reasons of withdrawing the manuscript.

Accepted articles in final stages of publication if are withdrawn, will entail withdrawal fees. The request will be processed by the editorial board and only serious genuine reasons will be considered if possible. The decision of the editorial board will be final and not negotiable. Unethical withdrawal or no response from the authors to editorial board communication will be subjected to sanction a ban to all authors, and their institute will also be notified.

It is a general principle of scholarly communications, that the editor of a journal is solely and independently responsible for deciding which articles submitted to the journal shall be published. In making this decision the editor is guided by policies of the journal's editorial board and constrained by such legal requirements in force regarding libel, copyright infringement and plagiarism.An outcome of this principle is the importance of the scholarly archive as a permanent, historic record of the transactions of scholarship.

Articles that have been published shall remain extant, exact and unaltered as far as is possible. However, very occasionally circumstances may arise where an article is published that must later be retracted or even removed. Such actions must not be undertaken lightly and can only occur under exceptional circumstances. In all cases, official archives of our journal will retain all article versions, including retracted or otherwise removed articles.

This policy has been designed to address these concerns and to take into account current best practice in the scholarly and library communities. As standards evolve and change, we will revisit this issue and welcome the input of scholarly and library communities. See also the National Library of Medicine's policy on retractions and the recommendations of the International Committee of Medical Journal Editors (ICMJE) concerning corrections and retractions.

Article withdrawal

Only used for Articles in Press which represent early versions of articles and sometimes contain errors, or may have been accidentally submitted twice. Occasionally, but less frequently, the articles may represent infringements of professional ethical codes, such as multiple submission, bogus claims of authorship, plagiarism, fraudulent use of data or the like. Articles in Press (articles that have been accepted for publication but which have not been formally published and will not yet have the complete volume/issue/page information) that include errors, or are discovered to be accidental duplicates of other published article(s), or are determined to violate our journal publishing ethics guidelines in the view of the editors (such as multiple submission, bogus claims of authorship, plagiarism, fraudulent use of data or the like), may be withdrawn.

Withdrawn means that the article content (HTML and PDF) is removed and replaced with a HTML page and PDF simply stating that the article has been withdrawn according to the Policies on Article in Press Withdrawal with a link to the current policy document.

Article Retraction

Infringements of professional ethical codes, such as multiple submission, bogus claims of authorship, plagiarism, fraudulent use of data or the like. Occasionally a retraction will be used to correct errors in submission or publication.The retraction of an article by its authors or the editor under the advice of members of the scholarly community has long been an occasional feature of the learned world.Standards for dealing with retractions have been developed by a number of library and scholarly bodies, and this best practice is adopted for article retraction by us. A retraction note titled "Retraction: [article title]" signed by the authors and/or the editor is published in the paginated part of a subsequent issue of the journal and listed in the contents list.In the electronic version, a link is made to the original article.The online article is preceded by a screen containing the retraction

or where the article, if acted upon, might pose a serious health risk. In these circumstances, while the metadata (Title and Authors) will be retained, the text will be replaced with a screen indicating the article has been removed for legal reasons.

Article Replacement

In cases where the article, if acted upon, might pose a serious health risk, the authors of the original article may wish to retract the flawed original and replace it with a corrected version. In these circumstances the procedures for retraction will be followed with the difference that the database retraction notice will publish a link to the corrected re-published article and a history of the document.

Licensing and Copyright Terms

Copyright

Biosc Biotech Res Comm has a policy of copy right, where all the published content of its scholarly articles by its authors can be used for immediate free access to the work and permitting any user to read, download, copy, distribute, print, search, or link to the full texts of articles, crawl them for indexing, pass them as data to software, or use them for any other lawful purpose.

All articles published by Biosc Biotech Res Comm will be distributed Freely under the terms and conditions of the Creative Commons Attribution License (CC-BY) https://creativecommons.org/licenses/by/4.0/.

Thus, any one is freely allowed to copy, distribute, and transmit the article on condition that the original article and source is correctly cited.

Licensing Policy

Biosc Biotech Res Comm has a policy of licensing for use and re- use of the published content without any embargo period, following policy that its authors are copyright holders of their scholarly work, granting usage rights to others using Creative Commons licenses for this purpose.

Privacy Statement

The names and email addresses entered in the journal site will be used exclusively for the stated purposes of the journal and will not be made available for any other purpose and will not be shared to any other party.

Guidelines for Reviewers

An unpublished manuscript is a privileged document. Please protect it from any form of exploitation. Don't cite a manuscript or refer to the work it describes before it has been published and don't use the information that it contains for the advancement of your own research or in discussions with colleagues. Adopt a positive, impartial attitude toward the manuscript under review, with the aim of promoting effective and constructive scientific communication.

If you believe that you cannot judge a given article impartially, please return it immediately to the editor. Reviews must be completed within 3 weeks. If you know that you cannot finish the review within that time, immediately return the manuscript to the editor.

In your review, consider the following aspects of the manuscript: –Adherence to style of the MS as set forth in Instructions to Authors of Biosc Biotech Res Comm

- Adequacy of title, abstract and its contents. Language and expression of findings in the manuscript.
- Significance of research questions or subject studied.
- Originality of work: It should be checked through standard plagiarism software only.
- Appropriateness of approach or methodology and adequacy of experimental techniques.
- Appropriateness of figures and or tables and length of article.
- Experimental data its presentation and interpretation.
- Soundness of conclusions and interpretation and relevance of discussion of the manuscript.
- Appropriate literature citations as per Harvard Style of References with updated references.
- Any help you can give in clarifying meaning in the manuscript will be appreciated. We prefer reviewers to use the manuscript comment review system, enabling the authors to make the necessary changes as suggested by the reviewers, which can be later checked for compliance.

If you wish to mark the text of the manuscript, use a pencil or make a photocopy, mark it, and return it together with the original. You can be particularly helpful in pointing out unnecessary illustrations and data that are presented in both tabular (and graphic) form and in detail in the text. Such redundancies are a waste of space and readers time.

A significant number of authors have not learnt how to organize data and will be benefit from your guidance. Do not discuss the paper with its authors. In your comments intended for transmission to the author, do not make any specific statement about the acceptability of a paper. Suggested revision should be stated as such and not expressed as conditions of acceptance. Present criticism dispassionately and avoid offensive remarks.

Organize your review so that an introductory paragraph summarizes the major findings of the article, gives your overall impression of the paper and highlights the major shortcomings. This paragraph should be followed by specific numbered comments which if appropriate may be subdivided into major and minor points. Confidential remarks directed to the editor should be typed (or handwritten) on a separate sheet, not on the review form. You might want to distinguish between revisions considered essential and those judged merely desirable.

Your criticisms, arguments and suggestions concerning the paper will be most useful to the editor and to the author if they are carefully documented. Do not make dogmatic, dismissive statements, particularly about the novelty of work. Substantiate your statements. Reviewer's recommendations are gratefully received by the editor. However, since editorial decisions are usually based on evaluations derived from several sources, reviewers should not expect the editor to honour every recommendation.

Editorial Committee of Bioscience Biotechnology Research Communications

The Editorial committee consisting of the Editor- in-Chief, Executive Editor, Associate Editors, Assistant Editor (s), Journal Managers and the Editorial Secretaries meet frequently to expedite the business of the journal. The editorial committee strictly follows the guidelines provided for international quality and transparent publication.

We strive to follow COPE's Principles of Transparency and Best Practice in Scholarly Publishing https://publicationethics.org/resources/guidelines-new/principles-transparency-and-best-practice-scholarly-publishing and encourage our publishing partners to uphold these same principles in general and International Committee of Medical Journal Editors in Uniform Requirements for Manuscripts Submitted to Biomedical Journals: Writing and Editing for Biomedical Publication which can be downloaded from http://www.icmje.org/

Advisory Board

An advisory board comprising of members with significant professional experience in different fields of biological and biomedical sciences helps the Editorial Committee o*f Bioisc Biotech Res Comm* in all policy matters when needed. Senior advisory board members from India as well as abroad are members of the journal. Each member has been selected due to the expertise and experience in the field of their specializations.

Editors Communique

Have we tamed the coronavirus? May be yes,
as pandemics do not die, they can only be faded !

Science and technology has made it possible, in the shortest span of time, it has shown that with firm determination and international cooperation, we can win over the onslaughts of even the worst of the pandemics. COVID-19 is perhaps fading over now, due to our coordinated efforts worldwide. Though we have lost millions, in the two year period, partly due to the mishandling of the viral attacks and somewhat by our own follies and carelessness. Anyway lessons learnt from the past, always make us more stronger and determined. Let us now not relax and work on a better mode, as all is still not well yet. The almost taming of the virus and its cousins have indicated some of the concealed failures, on which we have to focus now. We have to be more vigilant, and even a bit of laxity can spoil the good work done. On societal and governmental parts, utmost care and caution is required on a long term basis.

On behalf of Bioscience Biotechnology Research Communications, we falter at words to express our deep sense of solitude and grief on the catastrophic events of the world wide pandemic, spanning over two years now. We pray for the strength to bear this universal calamity and come up with long lasting fortitude to eradicate it soon.

Biosc Biotech Res Comm is an open-access international platform for publication of original research articles, exciting meta-reviews, case histories, novel perspectives and opinions in applied areas of biomedical sciences. It aims to promote global scientific research and development, via interactive and productive communications in these areas, helping scholars to present their cherished fruits of research grown on toiled and tilled trees of hard work in life sciences. Being the publication of a non-profit academic Society for Science and Nature, Bhopal India, since 2008, *Biosc Biotech Res Comm* strongly believes in maintaining high standards of ethical and quality publication.

Quality publication is one of the ways to keep science alive, and good journals have a leading role to play in shaping science for humanity! As teachers, we have great responsibilities, we have to advocate our students to accomplish and show them the path to test their mettle in hard times to excel, especially in the post COVID 19 era. Science and its advocates will rise more to the occasion and will soon provide succor to the already grief stricken humanity.

ABSTRACT

Basic research is appropriate for finding overarching principles of human behavior and biophysiological processes, whereas applied research is intended to demonstrate how these principles can be used to solve problems in a healthcare setting. Hence, this review paper examined the research design approaches in medical and clinical sciences, considering its strengths and weaknesses. Research process consists of the necessary steps or series of actions required to conduct a scientific research effectively and the desired sequencing of these steps. Research methods are classified into various types, which majorly include qualitative, quantitative, and mixed methods. Qualitative research could be phenomenological, grounded theory, ethnographic, or exploratory-descriptive in nature. Quantitative research uses numerical data to obtain knowledge about the world. Quantitative research conducted in medical and clinical sciences could involve; descriptive research, correlational research, quasi-experimental research, or experimental research in nature. However, qualitative research can also be helpful in examining subjects about which there is little information and in understanding subjective data. Mixed research methods combine quantitative and qualitative research methods in a single study. In general, the knowledge of research design can help researcher better plan the project utilizing the most appropriate methodologies and techniques.

KEY WORDS: RESEARCH DESIGN, QUANTITATIVE RESEARCH, QUALITATIVE RESEARCH, MIXED METHOD RESEARCH, MEDICAL AND CLINICAL SCIENCES.

INTRODUCTION

Research involves a systematic and controlled investigation through which data is collected, organized, analyzed, and interpreted to eliminate difficulties and improve conditions (Kerlinger, 1986). Research is a careful, systematic, organized pertinent study and investigation carried out in some field of knowledge to gather data or information to establish facts or principles. Leedy & Ormrod (2014) maintained that research is conducted for the purpose of description, exploring, explaining, and predicting. The fundamental principles that guide scientific research are empiricism, replicability, objectivity, systematic observation, reliability, accuracy, predictability, ethics, and generalization. Research is primarily committed to establishing systematic, reliable, and valid knowledge. As such, the purpose of conducting research includes; scientific study, generating new knowledge and/or finding truth, improving understanding, formulating/reviewing theories, clarifying fact, refining existing research method, decision making process for effective planning, program, and implementation, practical contribution and solving problem (Denzin & Lincoln, 2005).

A research design guides the planning and implementation of a conceived study to adequately answer generated questions or test-formulated hypotheses raised for investigation. Knowledge of the different research designs will select the design(s) appropriate for his study. Each design offers a unique approach or plan to answer the research question. Research approaches are plans and research procedures that span the steps from broad assumptions to detailed methods of data collection, analysis, and interpretation. This plan involves several decisions that involve an approach that should be used to study a topic (Cohen et al., 2011). The philosophical presumptions of the researcher, the inquiry processes (referred to as research designs), and the particular research techniques for gathering, analyzing, and interpreting data should be taken into caccount when making this choice. The type of investigation being conducted, the topic or problem of the research, the target audience for the

study, and the individual experience of the researcher all play a significant role in the choice of research method to be used (Streefkerk, 2022).

Research conducted in medical and clinical sciences varies considerably. Probably, most researchers are familiar with clinical research, basic (laboratory) research, healthcare (services) research, educational research, and health systems (policy) research. The research approach involves a systematic process that clearly defines the objective, managing the generated data, and communicating the research findings within established framework (research design) and in accordance with existing guidelines. Frameworks and guidelines provide researchers with an indication of what to include in the research, how to carry out the research, and what types of inferences are probable based on the collected data (Pandey & Pandey, 2015). Research in the medical and clinical sciences to solve everyday practical health-related problems. When organizing such a study, researchers must consider the presumptions they will apply, the research design, and the particular technique or procedures that will be adopted to carry out the strategy to achieve a desirable outcome (Lincoln et al., 2011).

Medical and Clinical sciences utilize either qualitative, quantitative or mixed methods; however, the researcher is at liberty to choose whatever kind of study to undertake from these three options. Researches involving the use of words (qualitative research) as opposed to figures (quantitative research) or closed-ended questions (quantitative hypothesis) compared to open-ended questions (qualitative interview questions) are common ways to distinguish between the types of research design to be adopted in a study. Both quantitative and qualitative research methods are intended to answer a particular kind of research issue, and examine and investigate the many claims of knowledge (Berg & Howard, 2012). The qualitative approach helps the researcher to investigate and acquire a deeper understanding the complexity of a phenomenon (subjective measurement), whereas the quantitative method offers an objective measurement of reality (Mertens, 2003).

Researchers therefore decides whether to use a qualitative approach, quantitative approach, or a mixed method approach when designing a medical or clinical research project. The latter strategy is based on the combination of quantitative and qualitative research methods (Kothari, 2014). However, the study problem or subject being researched, the audience for whom the researcher writes, and the researcher's own experiences all have an additional impact in determining the research approach of interest to be adopted in solving health related-problems in medical and clinical sciences.

Research Design: A research design is the framework or guide used for the planning, implementation, and analysis of a study. Research design refers to the overall strategy or plan for conducting a research study. A research design implies the procedural plan or framework adopted by a researcher in answering the generated questions validly, objectively, accurately and economically in a given research (Kumar, 2005). Research design involving qualitative, quantitative, and mixed method approaches constitutes the forms of inquiry that offer particular guidance for the procedures within a study design (Pathak, 2011). Research design is essential, considering that it sets the pathway for the study as a whole and ensures that the research in medical and clinical sciences are conducted meticulously and precisely. In addition, it describes the core aim and research objectives being adopted in a given study, as well as the research protocols and techniques employed in gathering and processing statisitcal data. In other words, a research design is the plan or blue print for testing formulated hypothesis or answering research questions generated in medical and clinical sciences research.

Research design equally outlines the fundamental techniques used by researchers to produce reliable and understandable findings. It therefore implies that some of the most significant methodological choices made by researchers are incorporated into the research design (Kerlinger, 1986). When conducting research in medical and clinical sciences, we must focus on a particular design that provides a framework for the study intervention and treatment, as this provides the research with a sense of the statistical methods and logistical arrangements needed in collecting, coding, presenting, analyzing, and interpreting the statistical data as it relates to health-related issues under study. Thus, before starting a research endeavor in medical and clinical sciences, it is critical and pertinent to comprehend and adopt a suitable research design for such study.

Research Design Used in Medical and Clinical Sciences: In the medical and clinical sciences, research design is used to investigate the causes, prevention, and treatment of diseases. Researchers in this field employ several methodologies, including case-control, cohort, and randomized controlled trials, to examine various aspects of health and health-related problems (Buiting et al., 2011). Types of research designs used in medical and clinical sciences falls into three broad categories, namely: quantitative research, qualitative research, and mixed methods. This is described as follows;

Quantitative Research: In formal, objective, systematic processes like quantitative research, numerical data are employed to gather knowledge about the outside world. Quantitative research design is aimed at discovering how many people think, act, or feel in a specific way. Quantitative research emerged around 1250 A.D. and was driven by investigators with the need to quantify data. Since then, the use of quantitative research as a means of generating new knowledge and understanding has taken center stage in western culture. A numerical or statistical approach to research design is what makes up a quantitative research method. According to Leedy & Ormrod (2014), because quantitative research expands on preexisting theories, it is specific in its surveying and experimentation approach. The methodology of a quantitative research maintains the assumption of an empiricist paradigm (Creswell, 2014). Such research, is probably independent of the researcher. Consequently, data are employed to measure reality

objectively. This implies that meaning is produced by quantitative research via objectivity found in the gathered data.

The method of assessing objective theories by looking at the relationship between variables is called quantitative research. In turn, these variables can be monitored, usually with devices, allowing for the statistical analysis of numbered data. The final written report follows a predetermined format that includes an introduction, methods, analyzes, review of findings, theory, and literatures, and discussion. Similar to qualitative researchers, people conducting this type of research have presumptions about the deductive testing of ideas, the inclusion of bias safeguards, the control of alternative explanations, and the ability to generalize and replicate the results. The purpose of quantitative research is to examine the relationship between variables, such as dependent, independent, and extraneous variables (Creswell, 2014). Data sources for quantitative research includes; ordinal or cardinal data from surveys, financial reporting, census reports, test scores, demographics, and/or observations. The analytic techniques used include; Descriptive statistics, regression, regression discontinuity and hierarchical linear modeling.

Quantitative research process involves: large sample sizes, concentrating on the quantity of responses. Methods of measurement commonly used in quantitative research include scales (nominal, ordinal, interval, and ratio), questionnaires (open and closed ended), and physiological measures (control, case, intervention and treatment etc). The data collected in quantitative research are numbers that are analyzed with statistical techniques to determine the results. In quantitative research design, closed-ended questions are typically preferred. Respondents typically will not be able to provide long, open-ended answers when given a predetermined selection of options. The goal of quantitative research is to apply the results outside the context in which it was conducted. The results of in-depth studies in medical and clinical sciences may be extrapolated to other people and environments. Quantitative research methods applicable in medical and clinical sciences include; experimental research, quasi experimental research, survey research, descriptive research, comparative research and correlational research (Lincoln et al., 2011).

Experimental research: Experimental research involves manipulation of variables after the research subjects have been divided into treatment groups. Experimental designs typically use random assignment, manipulation of an independent variable(s), and strict controls. Experimental research is a method of collecting information and data on a subject through observation in controlled settings. This is primarily concerned with the type of cause and effect study. It uses two sets of variables. Experimental research seeks to determine whether a specific treatment influences an outcome. A researcher uses the first set as a reference point to calculate the differences in the second set. In experimental research, the researcher identified the dependent and independent variables and sought to determine the effect of changes in the independent variables on the dependent variables. This is purely quantitative in nature and deals with future events. Experiments include true experiments, with random assignment of subjects to treatment conditions, and quasi experiments that use non-randomized assignments (Keppel, 1991).

The experimental design provides increased confidence in cause-and-effect relationships. Random assignment means that each subject had the same chance to be assigned to the control or experimental group. The use of random assignment of subjects attempts to eliminate systematic bias. Random assignment is different from random sampling. Random sampling means that each subject had an equal chance of being selected from a larger group to participate in the study. However, it is the random assignment to different conditions that distinguishes a true experimental design. When studying the direct causal or anticipated relationship between variables, real experiments must include randomization, a control group, and variable manipulation. When any of these conditions is not met, the design is no longer considered a legitimate experiment and is labelled as quasi experimental (Keppel & Wickens, 2003).

Studies in clinical and medical sciences adopts experimental research designs, and this can be animal experiment studies (Anachuna et al., 2018; Nwogueze et al., 2020; Enebeli et al., 2022; Nwogueze et al., 2023) and human or clinical experimental studies (Ofili & Ncama, 2014; Ofili et al., 2015; Nwogueze et al., 2024a; Ofili et al., 2024) in nature. The simplest of all experimental designs in medical and clinical sciences is the post-test-only control group. Other common true experimental designs include; pretest-posttest control group design, Soloman four group design, and cross-over design.

Quasi-experimental studies: The quasi-experimental research design is similar to the experimental research design, but it lacks one or more of the features of a true experiment. The effectiveness of medical and clinical interventions in foreseeing and regulating the outcomes sought for patients and families is determined through quasi-experimental research design. Quasi-experimental, like true experimental designs, examines cause-and-effect relationships between or among independent and dependent variables. However, one of the characteristics of true experimental design is missing, typically the random assignment of subjects to groups. Although, quasi-experimental designs are useful in testing the effectiveness of an intervention and thus can be considered closer to natural settings, these research designs are exposed to a greater number of threats of internal and external validity, which may decrease confidence and generalization of study findings (Fowler, 2009). The most common used quasi-experimental designs used in medical and clinical sciences are: nonequivalent group, pretest-posttest group design, control-group interrupted time series design, single-group interrupted time series design, and counter balanced design.

Survey Research: Survey approach involves research that collects information from a sample of people based on their response to questions. This kind of study permits usage of numerous techniques for participant recruitment,

instrumentation, and data collection. The methods used in survey research can be either quantitative (e.g. questionnaires having numerically rated items) or qualitative (such as using open-ended questions) or a combination of both (i.e., mixed methods). Surveys are widely used in research in social and psychological disciplines because they are frequently used to describe and examine human behavior, however, it can be used in research conducted in medical and clinical science discipline. By examining a sample of a population, survey research offers a quantitative or numerical account of the attitudes, trends, or opinions of that population. It comprises cross-sectional and longitudinal research with the goal of extrapolating the findings from a sample to the entire population, using questionnaires or structured interviews for data collection (Fowler, 2009).

Longitudinal research: this research examines data from across time. In a longitudinal study, participants are tracked over time as risk factors, health outcomes, or both are continuously or repeatedly monitored. In other words, the variables are measured repeatedly over different periods of time. These investigations come in a wide range of sizes and complexity. At one extreme, a sizable population may be researched for years. Most longitudinal studies look at the links between initial disease morbidity or death and exposure to known or suspected disease causes. The simplest design identifies a sample or cohort of subjects exposed to a risk factor and a sample of controls who were not exposed to the risk factor. The incidence of disease in each of the two groups is then assessed after prospective follow-up with each group. Estimating attributable and relative risks involves comparing incidence rates. Confounding variables can be taken into account in two ways: by matching the controls to the exposed individuals so that they have a comparable pattern of exposure to the confounder, or by determining the exposure to the confounder in each group and correcting for any variation in the statistical analysis. Case studies, historical studies, and genetic research are a few examples of this genre (Fowler, 2009).

Cross-sectional research: The gathering of pertinent information (data) at a certain point in time is what distinguishes cross-sectional studies from other types of research. Since all data are obtained and generally refer to the time at or around the time of the data collection, there is no time dimension involved in cross-sectional studies. Although, it is frequently said that data for cross-sectional studies is gathered at a specific point in time, the term "a point in time" is typically not defined or described. The study question may have an impact on the temporal dimension. Each component of the study, including the selection of study participants, the collection of data, and the definition of the conditions or qualities examined, must have a clear understanding of the temporal dimension (Fowler, 2009).

Descriptive research: Descriptive research explores new areas of research and describes situations as they exist in the world. A phenomenon or circumstance is described using this kind of study design. It involves gathering information using questionnaires, interviews, surveys, and observations. The researcher observes, describes, and documents various aspects of a phenomenon. There is no manipulation of variables or search for cause and effect related to the phenomenon. Descriptive designs describe what actually exists, determine the frequency with which it occurs, and categorize the information. Descriptive research can be useful in medical and clinical sciences to identify patterns, trends, and relationships of a given data (Keppel & Wickens, 2003).

Comparative research: Comparative research can also be called ex post facto or causal-comparative studies. Variations in the variables that naturally exist between two or more cases, subjects, or study units are described by comparative studies. Hence, when using a comparative design, researchers typically make assumptions about how two or more units' variables differ from one another. The main difference between this approach and the quasi-experimental design is the lack of researcher control of the variables (Creswell, 2009).

Correlational research: The purpose of the correlational study design is to determine whether two or more variables are related. Using such a research approach makes it easier to build and improve explanatory knowledge. It looks at relationships. Correlational designs, when compared to direct cause-effect correlations, include the systematic exploration of the nature of relationships, or associations between and among variables. Determining the direction and degree of association between variables is the goal of correlational research. Correlations analyze the direction, degree, magnitude, and strength of relationships or associations. The results of correlational studies provide the means for generating hypotheses to be tested in quasi-experimental and experimental studies (Bogdan & Biklen, 1992). Three of the most common correlational designs include; descriptive, predictive, and model testing correlational design.

Descriptive correlational designs: This types of descriptive correlation studies describes the variables and the relationships that occur naturally between and among them.

Designs for predictive correlation: The variance of one or more variables is predicted through predictive correlational research based on the variance of another variable (s). The study variables, like the experimental designs, are classified as independent (predictor) and dependent (outcome). These variables, however, are not managed and occur spontaneously.

Correlational design model testing: Correlational investigations are used to examine or pilot test potential relationships for a model or theory. The study variables, like experimental designs, are classed as independent (predictor) and dependent (outcome). The factors, however, are not adjusted and occur spontaneously.

Assumptions of quantitative research

- The following are the perceived key assumptions underlying the quantitative research approach;

- Quantitative research is concerned with questions about: how much? How many? How often? To what extent?
- Reality is objective, "out there" and independent of the researcher; therefore, reality is something that can be studied objectively;
- Research is based primarily on deductive forms of logic, and theories and hypotheses are tested in cause-effect order;
- The researcher should remain distant and independent of what is being researched;
- The goal is to develop generalization that contribute to theory that allows the researcher to predict, explain, and understand a phenomenon.
- Data analysis is mainly statistical, and the result of research is a number, or a series of numbers, presented in tables, graphs or other forms of statistics.

Strength and Weakness of Quantitative Research: The quantitative research approach has the following significant strengths. The first is that it can be administered and evaluated quickly. No time is needed in the organization before administering the survey, and the responses can be tabulated in a short period of time (Carr, 2014). Second, numerical data gathered using this approach promote effective comparisons between groups or variables, as well allows for examination of the extent of acceptance or rejection between respondents. Bryman, (2001) argued that the quantitative research approach is research that places emphasis on numbers and figures in data collection and analysis. Imperatively, the quantitative research approach can be seen as being scientific in nature. The use of statistical data for the research descriptions and analysis reduces the time and effort which the researcher would have invested in describing his result.

Third, the use of scientific methods for data collection and analysis makes generalization possible with this type of approach. The interaction made with one group can be generalized. Fourth, replicability is another benefit derivable from the use of this research approach. Since the research approach basically relies on hypotheses testing, the researcher does not need to do intelligent guesswork, he should follow clear guidelines and objectives (Lichtman, 2013). Finally, the advantage of legitimate quantitative data, that is, data which are collected rigorously, using the appropriate method and analyzed critically, is in their reliability, and therefore, can be repeated at any other time or place and still get the same results.

Quantitative research has the following weakness: Many crucial characteristics of individuals and societies are not meaningfully reduced to numbers or adequately understood without making reference to the local context in which people live. The detachment of the researcher from the participants means that he is an ‘observer’ or ‘looking in’ and can be considered a weakness within the quantitative research approach. With this type of researcher/participant relationship, it will be extremely difficult to get the in-depth study of the phenomena within its natural settings. In quantitative research, a large sample size is required; however, lack of resources often hinders effectiveness of large-scale research. Another weakness of quantitative data with regard to disaster survey, there is difficulty of in-depth description of the experience of disaster of an affected population.

Qualitative Research: A systematic subjective approach called qualitative research is used to describe and give meaning to circumstances and events in the real world. The basis of qualitative approaches is not a forecast between two variables. Rather, open exploration of a particular topic is done using qualitative methodologies. These techniques are especially helpful for examining subjects that are poorly understood and for comprehending subjective data, such as people's experiences. In qualitative research, the research process is inductive, rather than deductive, and begins with broad exploratory aims that provide a focus for study without preempting which aspects of the experience may be deemed important or relevant. When there is a knowledge gap or when little is known about a specific occurrence, experience, or notion, researchers utilize qualitative research designs. The goal of qualitative research is to understand or interpret the meanings people give to their experiences by observing people in their natural environments (Carr, 2014).

A method of investigating and understanding the meaning that individuals or groups assign to a social or human issue is called qualitative research. Emerging questions and processes, data acquired in the participant's context, inductive data analysis leading from specifics to broad themes, and the conclusions drawn by the researcher of what the data means are all part of the research process. The final written report is organized in a customizable way. In qualitative research, information is collected in the form of words that are then meaning-analyzed after being gathered through focus groups, observations, and interviews. Qualitative research findings are unique, dynamic, focus on understanding, and facilitate theory development. The purpose of qualitative research is to explore the meaning of people’s experiences, the meaning of the culture of the people, and how people view a particular issue or case (Yauch & Steudel, 2010).

Qualitative research is used to explore health-related or illness-related experiences or groups where little is known, or where current understanding seems inadequate. It is also used to get fresh perspectives on topics, populations, events, or ideas that have already been studied. Although it can be utilized concurrently or sequentially, it frequently comes before quantitative work. The most distinctive characteristics of qualitative research are that the researcher is also considered an instrument of data collection and the resulting data are mainly words or narrative descriptions rather than numbers (Carr, 2014). Data sources for qualitative research includes; normative data from interviews, documents, focus groups, and/or observations. The analytic techniques used include; thematic analysis, content analysis, and analysis of frequency. Types of qualitative research are discussed as follows;

Phenomenological study: Phenomenology uses an inductive, comprehensive approach to explain an experience

from the perspective of the person experiencing it, such as the lived experience of losing a child. The purpose of phenomenological research is to describe specific phenomena of interest as they are lived and experienced by individuals. This type of inquiry is derived from philosophy and psychology and involves the researcher summarizing participants' accounts of their lived experiences with a phenomenon. The focus of phenomenological studies is on understanding what an experience means within the context of people's lives.

This is referred to as capturing the lived experience. For a phenomenological study, the researcher purposefully chooses individuals or groups that have encountered the phenomena as their sample. The focus of the study determines the inclusion and exclusion criteria. The scope of the study, the nature of the subject, and the number of interviews conducted with each participant all play a role in estimating the size of the participant pool. The substance of the experiences for multiple people who have witnessed the event is summarized in this summary (Creswell, 2003). This design usually involves interviewing people and has solid conceptual foundations. Example: The experience of being with a seriously ill child.

Grounded theory research: Grounded theory research is an inductive research technique used to formulate, test and refine a theory on a particular phenomenon. A theory is developed based on the examination of data (rather than applying a predetermined theory). Researchers use a grounded theory design when they are interested in phenomena involving the social processes underlying human experiences and behavior. The aim of a grounded theory approach is the generation of theory that comes from or is 'grounded' in the data. The primary characteristics of grounded-theory designs are theoretical sampling and the constant comparison of data with emerging categories. This process involves using multiple stages of data collection and the refinement and interrelationship of information categories (Creswell, 2003).

Data collection and analysis occur simultaneously, and each piece of new data is constantly compared and contrasted with previously identified concepts. Sample sizes tend to be larger in grounded-theory designs, when compared to other qualitative designs, because of the need for theoretical sampling. Theoretical sampling means that the selection of participants is directed by the emerging analysis. In other words, the researcher begins with a focused sample, but as different concepts emerge, the researcher sought out additional participants based on a better understanding of these concepts. To obtain the whole spectrum of experiences or complete knowledge, this method frequently involves looking for outliers and bad situations. Theoretical sampling continues until the researcher is satisfied that the theory synthesized from the data and concepts is reflective of the social process under study. Example: Examination of the relationship between self-history and anorexia nervosa eating disorders using ground theory method.

Ethnographic research: Ethnography is the research method that comes to mind when considering the study of the shared pattern of language, behaviour, and action of a culture group in a natural setting over a prolonged period. It involves research intended to provide descriptions of systems, processes, or phenomena within their specific context. It was developed by the discipline of anthropology and sociology to investigate cultures through an in-depth study of the members of the culture. With the primary goal of advancing understanding and communication, the researcher's role in ethnography is to describe the special and distinctive practices or codes of conduct of the subculture or culture. Ethnography equally involves experiencing, most often by participant observation, enquiring, through interviews and oral histories, and examining, the study of cultural documents and artifacts.

Most of the time, ethnography is equated with the extended immersion of the researcher in the culture, group, or community under study. This is often referred to as fieldwork, and the extensive notes taken by the researcher are referred to as field notes. It is crucial to take into account cultural variations in health practices, while treating patients and their families. Researchers use ethnography as a research design when seeking a deeper understanding or description of a specific culture, group, or community (Dagn & Tebeje, 2021). Data collection often involves observations and interviews. Example: Investigation of barriers to the effectiveness of opioids in the management of cancer pain in Delta State.

Case-study research: An in-depth study of a particular case, which can be descriptive, explanatory, or exploratory. A case study is described as "an intensive study about a person, a group of people, or a unit, with the aim of generalizing over several units." Case-control studies involve a description of cases with and without a pre-existing condition or exposure. A rigorous and systematic assessment of a single person, group, community, or other unit in which the researcher looks at in-depth data related to various variables has also been referred to as a case study. When it is important to gain a thorough understanding of an issue, event, or phenomenon of interest in its authentic real-life setting, the case study approach is especially helpful to use. It discusses strange occurrences.

Depending on the content, it may be qualitative or quantitative in character. The cases, subjects, or units of study can be an individual, a family, or a group. Case-control studies are more feasible than experiments in cases in which the outcome is rare or takes years to develop (Bryman, 2008). This design is also known as a case report or case study. Example; Assessment of adolescent sexuality in females of childbearing age using a qualitative case study approach or Assessment Knowledge, attitude & adherence of among Type II Diabetes Mellitus patients to a given dietary regimen using a qualitative approach (Ofili et al., 2023).

Narrative inquiry: Narrative inquiry is a broadly determined and interpreted research design that involves individual narrative accounts and the interpretation of their meaning. Narrative accounts can be obtained from a number of groups including patients, family, and caregivers.

In narrative inquiry, the researcher studies the lives and experiences of individuals or groups by asking them to talk about or recount their experiences. The researcher then retells or restores the stories that emerge after analysis of the narratives within and between individuals. The main goal of narrative inquiry is to listen and challenge preconceived notions.

Children, for instance, are frequently understood through an adult proxy, primarily their parents. When children are asked to describe their own experiences, their narrative reports are often very different. The same is true for other people in the room and patients as well. The number of participants varies and depends on the general focus and scope of the study and the amount of information gained from each narrative account. To create a meta-narrative, or overarching story, the researcher first analyzes each participant's narrative individually, then compares them with those of other participants (Bryman, 2008; Dagn & Tebeje, 2021). Example: Evaluation of the life experiences of the Alzheimer's disease trends from childhood to adulthood.

Exploratory research: Exploratory research is conducted to address an issue or problem in need of a solution or understanding. Explanatory research focuses on why questions. Answering the 'why' questions involves developing causal explanations. Causal explanations argue that phenomenon Y is affected by factor X. Qualitative researchers' use this methodology to investigate a problem area using a variety of qualitative methodology with the goal of articulating the issue of interest and fostering knowledge. The way in which researchers develop research designs is fundamentally affected by whether the research question is descriptive or explanatory. It affects the information collected (Bogdan & Biklen, 1992).

Philosophical research: Philosophical research is entirely qualitative in nature. The researcher concentrates on how other people see the research subject matter. It is a method of research that aims to critically evaluate a philosophy or school of thought in order to gather new knowledge that can be applied to create new concepts, theories, or benchmarks. It involves research into the evolution of philosophical thought in general as well as philosophical history and various philosophers (Bogdan & Biklen, 1992; Johnson & Christensen, 2012).

Historical research: Historical research aims to provide descriptions of systems, processes, or phenomena within their specific context. To understand how previous events or ideas affected the events and ideas of the present, historians collect and analyze data on historical events or ideas. In order to understand how particular events affected the ones that followed, it investigates potential causes for those events. Historical research can give a scholar adequate knowledge about potential future events in addition to aiding in the identification of linkages between past and present events (Johnson & Christensen, 2012).

The primary sources of information used in historical research include documents from the time period studied, including historical records, books, photographs, letters, and other documentary evidence. Simply said, those sources were written by those who took part in or were present during the event.

Research can also benefit from secondary source materials, such as books and articles that were written after the events. However, secondary sources of information, which usually contain content that the writers developed, utilizing a range of sources, should be used with caution because they can be more slanted. It is important to note that primary sources might potentially be prejudiced and that there is no assurance of information authenticity because the research is looking for solutions in the past. The analysis of recent or distant past events is a component of historical study (Bogdan & Biklen, 1992). Example: Evaluation of breastfeeding trends among women attending the Federal Medical Center, Asaba, Delta State.

Assumptions of qualitative research: The following are the perceived key assumptions underlying the qualitative research approach;

- Qualitative research is concerned with finding the answer to questions that begin with why? how? In what way?
- A process of building a complex and holistic picture of the phenomenon of interest, conducted in a natural setting. Multiple realities exist in any given situation.
- When conducting qualitative research, the researcher collects data consisting mostly of words, pictures, observations of events, etc. These may eventually be categorized in some way and possibly quantified. The goal is to uncover and discover patterns of theories that help explain a phenomenon of interest
- The researcher interacts with those he/she studies and actively works to minimize the distance between the researcher and those being researched.
- Determination of accuracy involves verifying the information with informants or triangulation among different sources of information.
- Research is context-bound and is based on inductive forms of logic; categories of interest emerge mainly from informants (subject).
- Collect narrative data to gain insight into phenomena of interest. Data analysis includes the coding of the data and production of a verbal synthesis.

Strength and Weakness of Qualitative Research: Qualitative research has no structured procedure and is heavily dependent on the interpretation and ingenuity of the researchers who collects, interprets, and analyze the data. It is argued that it will not be possible to conduct the same research and get the same result at any other time and place. Qualitative research is not replicable as opposed to quantitative research (Lichtman, 2013). Qualitative methods that allow researchers to explore the views of homogeneous and diverse groups of people help to unpack these differing perspectives within a community.

The primary strength of the qualitative approach to cultural assessment is the ability to investigate the underlying values,

beliefs, and assumptions. Another strength of the qualitative research approach is that the investigation is broad and open-ended and allows participants to raise issues related to their opinion. Typically, a qualitative researcher does not have a finite or preconceived set of issues to explore. In testing hypotheses, quantitative researchers try to look at cause-and-effect relationships which perhaps enable them to predict and generalize their findings to a relevant larger population. This is not possible with a qualitative research approach (Johnson & Christensen, 2012).

Despite the usefulness of a qualitative research approach for conducting research, there are still some criticisms about the efficacy of the approach. The two main disadvantages of qualitative methods are that it takes a lot of time to complete and that it may leave out anything crucial. One possible difficulty is that all researchers' views are constrained and that a specific issue may go unreported. Additionally, because qualitative research is typically unrestricted, participants have a greater say on information gathered. Another drawback of qualitative approaches is that they require labor-intensive analysis procedures, such as recoding and categorization.

Lastly, competent interviewers are necessary to carry out the core data collection operations. However, replicability is another problem associated with a qualitative research approach. Critics of this approach argue that the constructivist has abandoned scientific methods and procedures of enquiry and investigation (Cohen et al., 2011). Meanwhile, nonuse of numbers by qualitative researchers makes it difficult and impossible to simplify findings and observations. Since the approach is characterized by feelings and personal reports, it is believed that the approach cannot provide reliable and consistent data compared to using quantifiable figures (Atkins & Wallac, 2012).

Mixed Method Research: Mixed method research is an approach to inquiry that combines quantitative and qualitative research methods in a single study. The mixed methods approach to research provided researchers with an alternative to believing that quantitative and qualitative research approaches are incompatible and, in turn, their associated methods ‘cannot and should not be mixed‘ (Mertens, 2003). Both the quantitative and qualitative components of the study are addressed by the specified research goal and questions. A mixed methods research design incorporates the collection of both qualitative and quantitative data, their integration, and the use of unique designs that may incorporate theoretical frameworks and philosophical presumptions. Depending on the objective of their study, researchers may be more focused on using a quantitative or qualitative research approach. In mixed methods research, qualitative and quantitative data are frequently collected and then analyzed (Bryman, 2012).

Methodologies in mixed method research are increasingly being used to increase the depth and breadth of understanding of medical and clinical phenomena. Mixed method research blends qualitative and quantitative research tools to broaden and deepen understanding. Selecting the right research method begin with identifying the research question and the objective of the study. Creswell, (2014) suggests that mixed method research is an approach in which the researcher collects analyze and interprets quantitative and qualitative data, integrates the two approaches in various ways, and frames the study within a specific design.

Mixed methods can be used to gain greater insight into relationships or discrepancies between qualitative and quantitative data; they can give participants a voice and a chance to share their experiences throughout the research process; and they can open up new lines of inquiry that strengthen the evidence and allow for more in-depth answers to research questions. This type of study is predicated on the idea that combining qualitative and quantitative methods yields a more thorough grasp of a research problem than each method alone. The use of mixed method can promote increased academic exchange and enhance researchers' experiences by bringing diverse viewpoints to bear on the topics under investigation.

Research topics that neither quantitative nor qualitative methods alone could address are best addressed by a mixed methods strategy. However, combining different approaches in a single study can make research more difficult to perform. As diverse research teams must become familiar with alternative research paradigms and various techniques to sample selection, data collection, data analysis, and data synthesis or integration, it frequently demands additional resources (time and staff) and more research training (Lichtman, 2013). Mixed methods research comprises different types of design categories, including; explanatory, exploratory, parallel, and nested (embedded) designs.

Explanatory sequential mixed methods: This is a research design in which the researcher first performs quantitative research, evaluates the findings, and then builds on the findings to provide a more thorough explanation using qualitative research. Because the qualitative data further explains the initial quantitative data results, it is regarded as explanatory. Because the qualitative phase comes after the first quantitative phase, it is regarded as sequential. This kind of design is common in disciplines with a strong focus on numbers (the project starts with quantitative research). However, it may be difficult to identify the quantitative results to investigate further because there are different sample sizes for different stages of the investigation (Lichtman, 2013). Example: Identify levels of stress among interns working in hospital emergency room settings or assessing awareness & utilization levels of medical students towards insecticide-treated bed nets as measure for reducing malaria (Ofili & Nwogueze, 2024)

Exploratory sequential mixed methods: This is the explanatory sequential design is a reverse sequence. Under the exploratory sequential technique, the researcher starts by examining the perspectives of the participant during a qualitative research phase. After that, the data are examined and the results are utilized to construct a second quantitative phase. The development of an instrument that best fits the study sample, the selection of relevant instruments for the quantitative follow-up phase, or the specification of variables required for a quantitative follow-up study are

all possible uses for the qualitative phase. The focus on the relevant qualitative findings to employ and the selection of samples for both research stages present unique challenges to this strategy (Lichtman, 2013). Example: Identify the highest sources of workplace stress among physicians on internship working in the hospital emergency room or assessing levels of Serum Zinc and body mass index as Trajectory for hyperlipidemia and dyslipidemia among Welders following exposure to Welding Fumes & Smoking (Nwogueze et al., 2024b)

Convergent parallel mixed methods: To provide a thorough examination of a particular research topic, researchers would sometimes converge or integrate quantitative and qualitative data in a mixed methods research design. When using this strategy, the researcher usually gathers both types of data at about the same time and combines the data to evaluate the overall findings. In this design, discrepancies or inconsistent results are clarified or further investigated (Lichtman, 2013; Yauch & Steudel, 2010). Example: Identify sources of stress for nurses working in emergency room settings, personal coping strategies used, and types of programs or support systems provided by hospitals or assess pulmonary function parameters among females having Type II Diabetes (Eke et al., 2019).

Embedded (Nested) mixed methods: The fundamental principle of this design is that either quantitative or qualitative data are contained within a broader design (like an experiment), and the data sources play a supportive role in the overall design. This design also incorporates the usage of data in a convergent or sequential manner. Example: Test an online peer support program designed to reduce workplace stress for new medical house officers working in the hospital emergency room or evaluate the cognitive behaviour of health workers as it concerns sedentary lifestyle and physical activities during COVID-19 Pandemic (Nwogueze & Ofili, 2023).

Transformative mixed methods: This design incorporates both quantitative and qualitative data, with an overall perspective provided by a theoretical lens derived from social justice or power. In this kind of investigation, the data may be sequentially arranged with one building upon the other, or they may converge.

Multiphase mixed methods: In the domains of program interventions and evaluation his approach is typical. This advanced design best understands a long-term program goal by using sequential or concurrent procedures in tandem over time.

CONCLUSION

Understanding how to select the best design to answer a research question or test a hypothesis is the first step in conducting meaningful research that can be used to generate evidence that informs medical and clinical practice. The first and most crucial stage in conducting scientifically sound research, whether qualitative or quantitative, is to narrow the research topic and select the appropriate study design to address it. Both quantitative and qualitative approaches look at and examine various knowledge claims, and both are intended to respond to a particular research issue. The qualitative approach enables the researcher to investigate and gain a deeper understanding of the intricacy of a phenomenon, while the quantitative method offers an objective measurement of reality. The goal of researchers using mixed methods design is to draw from the strengths of quantitative and qualitative research approaches while minimizing its weaknesses. Becoming familiar with the research methods used in medical and clinical sciences allows a researcher to understand them more effectively. This is crucial for the study of human beings in both health and sickness, since a wide variety of research designs can be applied.

In-Vitro Assessment of Free Radical Scavenging Potential of Selected Stem Extracts of *Cissus quadrangularis* Using Different Solvents

Arvind Kumar and Vinay Bhushan Kumar*
TPS College Patliputra University, Patna India.

ABSTRACT

The utilization of Cissus quadrangularis and other medicinal plants in traditional and modern medicine holds promise for the prevention and management of oxidative stress-related maladies. The aim of present work was to assess the free radical scavenging potential of the selected bioactive component of stem extract using different solvent (aqueous, methanol, dichloromethane, acetone and chloroform) of the plant Cissus quadrangularis. Antioxidant activity of the selected phytochemical of stem extract of the plant Cissus quadrangularis were done by Ferric reducing antioxidant power assay, DPPH antioxidant power assay and hydroxyl radical scavenging activity. The analysis of ferric reducing antioxidant power assay indicate that all tested solvent extract have good antioxidant potential as compare to ascorbic acid which was taken as reference. Acetone extract expressed maximum antioxidant potential with EC50 value 0.17 and chloroform extract expressed minimum antioxidant potential with EC50 value 0.35. The order of ferric reducing antioxidant potential among the tested solvent are as s follow: Acetone > Dichloromethane > Methanol > Aqueous > Chloroform. The results of the present study showed that all the extracts exhibited potent antioxidant activity. The analysis of DPPH antioxidant power assay, HRS antioxidant power assay and Ferric reducing antioxidant power assay indicate that all tested solvent extracts have good antioxidant potential and among the five extracts methanolic, dichloromethane, and acetone extract respectively exhibited higher potency of free radical scavenging activity.

KEY WORDS: ANTIOXIDANT, CISSUS QUADRANGULARIS, DPPH, FRAPA, HRSA, OXIDATIVE STRESS. REACTIVE OXYGEN SPECIES.

INTRODUCTION

Oxidative stress is one of the major region for the initiation and progression of cancer, mellitus, diabetes, neurodegenerative diseases, cardiovascular diseases and inflammatory diseases among other syndromes (Arika et al., 2019). The condition of oxidative stress arises due to the excessive generation of free oxygen and nitrogen species or their inefficient quenching within the cell (Bhat A.H. et al., 2015). Free radicals, a natural byproduct of cellular metabolism, are continuously generated in the human body as a consequence of oxygen utilization by the cells. This process, known as oxidative metabolism, occurs during various physiological activities, including respiration and energy production.

The mitochondria, often referred to as the powerhouse of the cell, are particularly implicated in this process. Free radicals are highly reactive molecules with unpaired electrons, capable of damaging cellular components such as DNA, proteins, and lipids. While the body has defense mechanisms to neutralize these harmful effects, excessive free radical production or inadequate antioxidant defenses can lead to oxidative stress, contributing to various diseases and aging processes (Moriasi et al., 2020).

Free radicals play a fundamental role in any biochemical process and constitute an essential component of aerobic life and metabolism (Tiwari 2001). Reactive oxygen species (ROS) and reactive nitrogen species (RNS) arise from normal cellular metabolism. The prevalent ROS consist of the superoxide anion, hydrogen peroxide (H2O2), peroxyl (ROO) radicals, and reactive hydroxyl (OH) radicals. Nitrogen-derived free radicals include nitric oxide and peroxynitrite anion (ONOO) (Joyce 1987). Reactive oxygen species and reactive nitrogen species are linked to numerous pathological conditions, including atherosclerosis, ischemia, tissue reperfusion injury, central nervous system damage,

gastritis, and cancer (Manoharan et al., 2005). Endogenous sources of free radicals comprise electron transfer chain reactions in the mitochondria, the xanthine oxidase pathway, and occurrences during disease states such as inflammation, ischemia, and reperfusion injury (Moriasi et al., 2020).

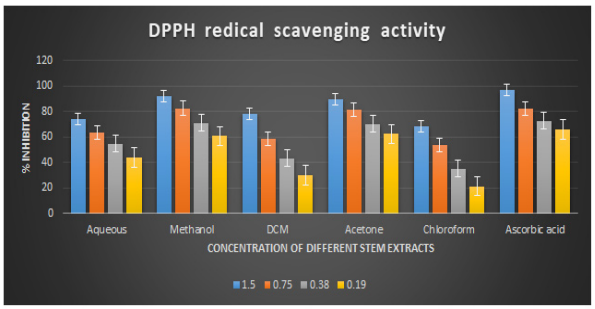

Figure 2: DPPH radical scavenging activity of different plant extracts of the plant Cissus quadrangularis.

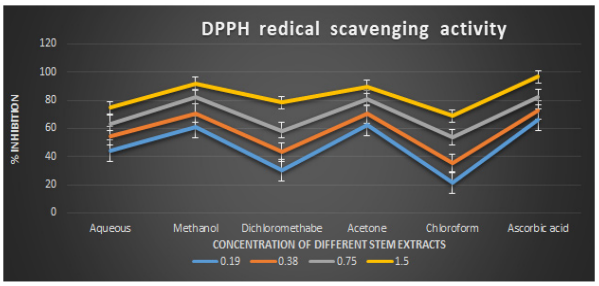

Figure 3: Hydroxyl radical scavenging activity of different plant extracts of the plant Cissus quadrangularis.

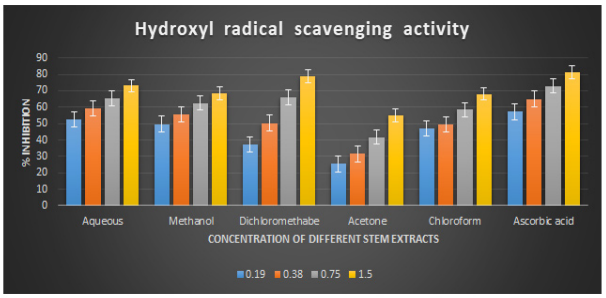

Many antioxidants are utilized to eliminate these free radicals. They exert a protective effect by neutralizing free radicals, toxic byproducts of natural cell metabolism. The human body employs various mechanisms to counteract oxidative stress by producing antioxidants, which are either naturally produced in situ or externally supplied through foods and/or supplements. These antioxidants function as free radical scavengers, preventing and repairing damages caused by ROS. Consequently, they can enhance immune defense and reduce the risk of cancer and degenerative diseases (Ganapaty et al., 2007).

Conventionally, oxidative stress is typically addressed through the utilization of various types of synthetic antioxidant compounds, such as butylated hydroxyanisole (BHA), butylated hydroxytoluene (BHT), and propyl gallate (PG). However, despite their widespread use, these synthetic antioxidant compounds have been linked to undesirable effects (Ndhlala et al 2010). To overcome the harmful effects of synthetic antioxidants, an available alternative is the use of medicinal plants, which offer potent, safer, more affordable, and easily accessible therapies for oxidative stress-related ailments (Goyal et al 2019).Plants are acknowledged as significant sources of novel drugs, offering key molecules of pharmacological interest. Their established applications in traditional medicines have garnered significant attention as a central focus of research (Javaid et al., 2023).

Presently, researchers are directing their focus towards phytochemicals for managing and treating various human diseases. It's noteworthy that over 50% of all modern clinical drugs originate from natural products, underscoring their pivotal role in the development of pharmaceuticals within the industry (Bardoloi et. al., 2018). Ayurveda, Unani, Siddha, and modern medicinal systems utilize numerous plants in the treatment of various diseases (Jainu et al., 2004). In the Indian subcontinent, there exists a vast array of medicinal plants that are utilized as drugs for treating numerous diseases (Ballabh et al., 2007). *Cissus quadrangularis* stands out as one of the most beneficial flora among them.

Cissus quadrangularis, a perennial herb of the grape family, features a stout, fleshy quadrangular stem with medicinal properties found throughout the tropical regions of the Earth. Also known as Cissus succulent, it is popularly referred to as horjora in Hindi and pirandai in Tamil, and belongs to the family Vitaceae. This plant is extensively utilized in India and is believed to be native to India, Sri Lanka, Malaysia, Java, and West Africa. Widely observed in tropical forest regions of Asia and Africa, *Cissus quadrangularis* is an evergreen climber that grows at a rapid rate (Ruskin et al., 2014).*Cissus quadrangularis* has been extensively studied for its phytochemical composition, pharmacological activities, and toxicological evaluation. Numerous phytochemicals, including alkaloids, tannins, lignins, suberins, phenols, flavonoids, resveratrol, piceatannol, pallidol, perthenocissin, phytosterols, and others, have been identified in the plant extract of *Cissus quadrangularis* (CQ) (Sundaran et al., 2020).

Among these, ascorbic acid, triterpenes, beta-sitosterol, ketosterol, two asymmetrical tetracyclic triterpenoids, and calcium have been recognized as the major phytochemicals of this plant (Jainu et al., 2004). *Cissus quadrangularis* exhibits a diverse range of beneficial properties, including antimicrobial, antioxidant, anti-inflammatory, anti-cancerous, and cytotoxic effects. Furthermore, it has been observed to promote bone healing, making it particularly valuable in traditional medicinal practices.

Its antimicrobial properties make it effective against various pathogens, while its antioxidant and anti-inflammatory actions contribute to overall health and wellness. Additionally, its potential anti-cancer properties offer promise in combating malignancies, and its ability to aid in bone healing underscores its importance in orthopedic medicine. These multifaceted properties highlight the potential of Cissus quadrangularis as a valuable therapeutic agent in the treatment of various ailments., Panche et al 2016, Chinthamani et al 2014, Murthi et al 2003, Kuppuramalingam et al 2018 & Rekha et al 2019, Anwar et al 2021 and Dinesh et al 2021).

MATERIALS AND METHODS

Preparation of stem extract: The fresh stems of *Cissus quadrangularis* (CQ) were harvested from Supaul district in Bihar, India (Latitude 26.5520640 and Longitude 87.0555330) (Figure 1). Authentication of the plant and stem was conducted by Prof. Rimjhim Sheel, Former Head, University Department of Botany & Dean Faculty of Science and Principal GDM College. Patliputra University, Patna. A voucher specimen has been preserved in the University Department of Botany at Patliputra University, Patna, Bihar, India for future reference. After collection, the stems were cleaned thoroughly by washing them in tap water followed by rinsing with distilled water. Subsequently, the stems were shade dried and ground into a fine powder. The powdered material was then stored in a clean, airtight container for further use. All the chemicals utilized in this study were procured from two suppliers: Bihar Scientific Company and Krishna Scientific, both located in Patna, Bihar, India.

Soxhlet extraction: The dried powder of *Cissus quadrangularis* stems (50g) was packed into the thimble of a Soxhlet apparatus. Successively, 400 ml of methanol, acetone, chloroform, dichloromethane, hexane, and aqueous solvents (referred to as MACDHA) were employed as solvents one after the other. These solvents were utilized to dissolve the active biomolecules present in the plant material. The stems remained as precipitate while the active biomolecules were extracted into the solvent. The extraction process was continued until the solvent in the thimble appeared clear, typically taking approximately 8 hours on average. Subsequently, the solvent extract was evaporated in a water bath until a dark orange residue was obtained. The percentage yield was 12%, 8%, 7%, 9%, 10% and 12% for methanol, acetone, chloroform, dichloromethane, hexane and aqueous (MACDHA) respectively. The extract were kept at -200 C till further use. All the process of Soxhlet extraction was completed in University Department of botany and Department of Botany TPS College, Patliputra University.

Estimation of free radical scavenging activity: Antioxidant activity of the selected phytochemical of stem extract of the plant *Cissus quadrangularis* were done by the following methods.

Determination of 1,1, dipheny-2-picrylhydrazyl (DPPH) Radical Scavenging Activities: The DPPH radical scavenging assay was conducted following the protocol outlined by Brand-Williams et al. with certain modifications. In brief, five different concentrations of the plant extracts under investigation (0.0625, 0.125, 0.25, 0.5, and 1 mg/ml) were prepared in methanol (analytical grade). Equivalent concentrations were also prepared for L-ascorbic acid, serving as the standard antioxidant. Subsequently, 1 ml of each plant extract was transferred into a clean test tube, to which 0.5 ml of 0.3 mM DPPH solution in methanol was added.

The mixture was then shaken and left to incubate in the dark at room temperature for 15 minutes. Blank solutions, consisting of the plant extract solutions (2.5 ml) and 1 ml of methanol, were utilized as the baseline. The negative control was composed of 2.5 ml of DPPH solution and 1 ml of methanol, while L-ascorbic acid at equivalent concentrations to the plant extracts served as the positive control.

Following the incubation period in darkness, the absorbance values were measured at 517 nm using a spectrophotometer. All experiments were conducted in triplicate. The DPPH radical scavenging activity was calculated using the equation as described by Brand-Williams et al. Where, As is absorbance of the sample and Ac is absorbance of the control. The half maximal inhibitory concentration (IC_{50}) of the extracts was computed from a plot of percentage DPPH free radical inhibition versus the extract concentration.

Determination of Hydroxyl Radical Scavenging Activity: The following steps were conducted to determine the Hydroxyl Radical Scavenging Activity of the plant extracts by the method outlined by Klein et al. (1991) with certain modifications: A solution containing 0.13% ferrous ammonium sulfate and 0.26% EDTA was prepared. 1 mL of the prepared Iron-EDTA solution was mixed with various concentrations of plant extracts. To this mixture, 0.5 mL of EDTA solution (0.018%) and 1 mL of DMSO (0.85% v/v in 0.1 M phosphate buffer, pH 7.4) were added. The reaction was initiated by adding 0.5 mL of ascorbic acid (0.22%). The reaction mixture was then incubated at a temperature ranging from 80 to 90°C for 15 minutes in a water bath. After incubation, the reaction was terminated by adding 1 mL of ice-cold trichloroacetic acid (TCA) (17.5% w/v).Following TCA addition, 3 mL of Nash reagent was added to the reaction mixture. The reaction mixture was allowed to stand at room temperature for 15 minutes. The absorbance of the reaction mixture was measured spectrophotometrically at 412 nm against a reagent blank. The percentage of hydroxyl radical scavenging activity was calculated using the following formula:

$$\% \text{ Radical scavenging activity} = \frac{Ac - As}{Ac} \times 100$$

Where, As is absorbance of the sample and Ac is absorbance of the control. The half maximal inhibitory concentration (IC_{50}) of the extracts was computed from a plot of percentage DPPH free radical inhibition versus the extract concentration.

Ferric Reducing Antioxidant Power Assay: The reducing power of the extracts was assessed following the method outlined by Oyaizu et al. (1986) with slight modifications. Four different concentrations of aqueous extract (1.5 mg, 0.75 mg, 0.38 mg, and 0.19 mg) along with L-ascorbic acid at equivalent concentrations were mixed with 2 ml of phosphate buffer (0.2 M, pH 6.6) and 2 ml of 1% potassium ferricyanide. The mixtures were then incubated at 50°C for 20 minutes. Subsequently, 2 ml of 10% trichloroacetic acid was added, followed by centrifugation at 1000 rpm for 10 minutes. The supernatant (2 ml) was aspirated and mixed with 2 ml of distilled water and 1 ml of 0.1% ferric chloride. The absorbances were measured at 700 nm using a UV-Vis spectrophotometer and recorded. The concentration of each extract capable of producing an absorbance value of 0.5 was determined from the graph of absorbance at 700 nm against extract concentration. This concentration was considered as the median effective concentration (EC_{50}).

RESULT AND DISCUSSION

The stems of CQ were freshly collected from Supaul district of Bihar, India (Latitude 26.5520640 and Longitude 87.0555330). Authentication of the plant and stem was performed by Prof. Rimjhim Sheel, Former Head, University Department of Botany & Dean Faculty of Science and Principal GDM College, Patliputra University, Patna.

Reactive oxygen species (ROS) or free radicals are natural byproducts of cellular metabolic reactions. However, when they accumulate in cells, they can transform into highly toxic substances that damage essential cellular components such as DNA, RNA, proteins, and lipids (Ali S. S. et al., 2020). These accumulated damages can contribute to the development of chronic diseases including cancer, diabetes, and heart diseases (Hajam Y. A. et al., 2022). Balancing the effects of ROS is crucial, and external antioxidants play a significant role in this process. Plants, being a major part of our diet, serve as the primary source of these antioxidants (Nwozo O. S. et al., 2023).

The processing and extraction of the leaves and stems of CQ were conducted accordingly, and the extracts were obtained using various solvents (Acetone, Chloroform, Methanol, Dichloromethane, and Aqueous). These extracts were then subjected to further analysis for radical scavenging activity. The results of the scavenging activity are tabulated below.

DPPH antioxidant power assay

Comparative analysis of % inhibition by plant extract of different solvents. (Table 1)

Graphical presentation of % inhibition by plant extract of different solvents.

DPPH˙ (1,1-Diphenyl-2-picrylhydrazyl) is a stable nitrogen-centered free radical with an unpaired electron at one atom of the nitrogen bridge. The scavenging of DPPH free radicals is a widely used method for assessing antioxidant activity. This assay measures the ability of antioxidants to directly scavenge DPPH˙ radicals by monitoring changes in absorbance using a spectrophotometer at a wavelength of 517 nm (Kedare S. B. et al., 2011). The DPPH radical scavenging assay offers a quick and simple way to evaluate the antioxidant activity of various plant extracts. In this study, the Acetone, Aqueous, Chloroform, Dichloromethane, and Methanol extracts of Cissus quadrangularis stems were assessed for their ability to scavenge free radicals using DPPH˙ as the substrate.

This assay measures the hydrogen or electron donating ability of the stem extracts. The extracts of Cissus quadrangularis stems were found to reduce the stable purple color of DPPH (1,1-diphenyl-2-picrylhydrazyl) free radicals to yellow-colored 1,1-diphenyl-2-picrylhydrazine. The reduction capacity increased with increasing concentration of the extract. Analysis of the DPPH antioxidant power

assay indicated that all tested solvent extracts exhibited good antioxidant potential compared to ascorbic acid, which was used as a reference antioxidant.

The IC_{50} values for aqueous, methanol, dichloromethane, acetone and chloroform extracts are 0.28, 0.09, 0.51, 0.08, and 0.63 mg/ml respectively was compared with standard ascorbic acid (IC_{50} = 0.07 mg/ml) ($p < 0.05$; Table 1). Furthermore, it was demonstrated that the IC_{50} value for L-ascorbic acid was lower than the IC_{50} values of all the studied plant extracts. At all the tested concentration the maximum DPPH˙ radical scavenging activity was 91.88±0.08 % for methanol extract and minimum was 21.45±0.11 for chloroform extract among the plant extracts ($p < 0.05$; Table 1 and Fig 1).

Furthermore, it was demonstrated that the DPPH˙ radical scavenging activity of ascorbic acid was maximum at all the concentration against plant extracts. The decreasing order of 1,1-diphenyl-2-picrylhydrazyle radical scavenging activity of the different extract was found to be Methanol > Acetone > Dichloromethane > Aqueous > Chloroform ($p < 0.05$; Table 1 and Fig 1) with correlation coefficient 0.95, 0.96, 0.98, 0.96 and 0.96 respectively.

The hydroxyl radical, being the most reactive oxygen-centered species, can cause significant damage to adjacent biomolecules. In this study, the hydroxyl radical scavenging assay was conducted by generating hydroxyl radicals using ascorbic acid and EDTA. The hydroxyl radicals were formed through an oxidation reaction with dimethyl sulfoxide (DMSO), resulting in the production of formaldehyde, which provided a convenient method for detecting hydroxyl radicals by treatment with Nash reagent. All the extracts of Cissus quadrangularis, when added to the reaction mixture, exhibited the ability to scavenge hydroxyl radicals in a concentration-dependent manner.

This scavenging activity could be attributed to the presence of phenolic compounds in the extracts, which possess hydrogen-donating abilities. Analysis of the hydroxyl radical antioxidant power assay revealed that all tested solvent extracts (aqueous, methanol, dichloromethane, acetone, and chloroform) displayed significant antioxidant potential compared to ascorbic acid, which served as the reference antioxidant in this study.

The IC_{50} values for aqueous, methanol, dichloromethane, acetone and chloroform extracts are 0.16, 0.19, 0.37, 1.23, and 0.36 mg/ml respectively was compared with standard

ascorbic acid (IC_{50} = 0.11 mg/ml) ($p < 0.05$; Table 3) Furthermore, it was demonstrated that the IC_{50} value for L-ascorbic acid was lower than the IC_{50} values of all the studied plant extracts. At all the tested concentration the maximum hydroxyl radical scavenging activity was 78.90±0.26 % for dichloromethane extract and minimum was 25.43±0.08 for acetone extract among the plant extracts ($p < 0.05$; Table 3 and Fig 3). The decreasing order of hydroxyl radical scavenging activity of the different extract was found to be Dichloromethane > Aqueous > Methanol > Chloroform > Acetone ($p < 0.05$; Table 3 and Fig 3) with correlation coefficient 0.96, 0.97, 0.96, 0.99, and 0.99 respectively.

Graphical presentation of absorbance value of Ferric reducing antioxidant power assay by plant extract of different solvents.

This method is based on the ability of the analyte to reduce ferric ions (Fe3+) to ferrous ions (Fe2+) (Gulcin I., 2010 & MacDonald-Wicks L. K. et al., 2006). Therefore, the formation of Fe2+ can be assessed by measuring the absorbance capacity at 700 nm. Increases in absorbance at this wavelength indicate an increase in reducing power. The analysis of the ferric reducing antioxidant power assay revealed remarkable concentration-dependent increases in absorbance values at a wavelength of 700 nm (Table 2) compared to ascorbic acid, which was used as the reference antioxidant in this study. The half-effective concentrations (EC50) of the studied plant extracts required to produce an absorbance value of 0.5 were determined in this study.

The EC50 values for aqueous, methanol, dichloromethane, acetone and chloroform extracts are 0.23, 0.23, 0.18, 0.17, and 0.35 mg/ml respectively was compared with standard ascorbic acid (IC_{50} = 0.07 mg/ml) ($P < 0.05$; Table 2). Furthermore, it was demonstrated that the EC50 value for L-ascorbic acid was lower than the EC50 values of all the studied plant extracts. At all the tested concentration the maximum absorbance value for ferric reducing antioxidant activity was 2.089±0.002 for acetone extract and minimum was 0.342±0.001 for aqueous extract ($p < 0.05$; Table 2 and Fig 2).

Furthermore, it was demonstrated that the absorbance value for ferric reducing antioxidant activity of ascorbic acid was significantly maximum at all the concentration against plant extracts (table 2). The decreasing order of ferric reducing antioxidant activity of the different extract was found to be Acetone > Dichloromethane > Methanol > Aqueous > Chloroform ($p < 0.05$; Table 2 and Fig 2) with correlation coefficient 0.99, 0.99, 0.99, 0.98 and 0.99 respectively.

CONCLUSION

Today, there is a growing interest in the antioxidative properties of plants due to their potential use as natural additives to replace synthetic ones. The results of the present study demonstrate that all the extracts exhibited potent antioxidant activity. Analysis of the DPPH antioxidant power assay, HRS antioxidant power assay, and Ferric reducing antioxidant power assay indicated that all tested solvent extracts possessed good antioxidant potential. Among the five extracts, methanolic, dichloromethane, and acetone extracts respectively exhibited higher potency of free radical scavenging activity. These findings suggest that the stem extract of the plant Cissus quadrangularis could serve as a valuable source of natural antioxidants for promoting health benefits. Further isolation of bioactive compounds is recommended to identify the unknown compounds and establish their pharmacological properties.

Analysis of Coagulation Profile and Possible Mechanism of Coagulation Activation in COVID-19 Patients: A Systematic Literature Review

Sheetal Mali* and Rekha Khanna
Government Madhav Science College, Ujjain, Madhya Pradesh, India.

ABSTRACT

The ongoing COVID-19 pandemic has caused a global health crisis with serious impacts that extending beyond the acute infection stage. This comprehensive review of literature looks at the mechanism of coagulation activation during COVID-19 as well as the examination of coagulation profile in infected patients. Prolonged prothrombin time (PT), higher D-Dimer, thrombocytopenia, and altered coagulation factors activity are indicators of hypercoagulability in severe cases. Long-term COVID-19 sequelae indicated persistent difficulties, such as psychological and physical disorders, that are revealed throughout the post-recovery phase. Multiple studies have shown a correlation between the severity of the disease and coagulation issues, highlighting the importance of a thorough coagulation profile investigations in COVID-19 patients after recovery.

Mechanistically, the inflammatory response initiates a cytokine storm that activates monocytes, platelets, and endothelial cells. The viral spike protein interacts with the ACE2 receptors of endothelial cells, causing endothelial damage and activating procoagulant pathways. In addition, alterations in the renin-angiotensin system (RAS) intensify vasoconstriction, inflammation, and pro coagulation. Recognizing these intricate biochemical processes, it is essential to predict and manage chronic consequences related to coagulation factors. In patients who have recovered, early examinations of coagulation parameters may help with early medications, which could prevent thrombotic incidents.

INTRODUCTION

Coronavirus disease 2019 (COVID-19) is a global health crisis that emerged in Wuhan City, China on December 3, 2019, and is still an ongoing pandemic worldwide. According to data from the Indian Government, India is ranked second in the world, with 44,996,963 confirmed COVID-19 cases and had the third highest number of 531,928 COVID-19 deaths (Ritchie et al. 2022). Although the patients recovered from infection, after effects of COVID-19 do not end with infection resolution, as reported in studies (Del Rio, Collins and Malani, 2020), patients after 12 weeks of COVID-19 recovery experienced a wide range of mental and physical complications with specific organ dysfunctions involving heart, lung and brain, and stated that major consequences of COVID-19 increased the incidences of heart failure in young population and athletes and also decline in lung functions and neurological manifestations. Studies also support the hypothesis of severe major consequences reported earlier due to long COVID-19 sequelae by examining blood samples from 70 South African long COVID-19 patients, (Pretorius et al., (2021).

All the results showed platelet pathology and substantial fibrin amyloid microclots which can be linked to chronic symptoms that persisted even after the subsidence of acute COVID-19. Coagulopathy is an emerging hallmarks of COVID-19 induced by the hyperinflammatory response. The authors also found that elevated coagulation parameters such as prothrombin time (PT), activated partial thromboplastin time (APTT), D-dimer, and thrombocytopenia are associated with higher mortality from COVID-19. Hence, examination of these factors is important to determine the level of coagulopathy, (Wang et al 2020).

The major issue that needs to be addressed is the emergence of mysterious clots that result in coagulation irregularities and thrombosis. An earlier detection of thrombotic events will be possible by the increased knowledge of thrombotic consequences in recovered individuals. The primary objective of this literature review is to analyze studies investigating coagulation parameters in COVID-19 patients and to provide an overview of the mechanisms underlying COVID-19-associated coagulopathy.

MATERIAL AND METHODS

Search Strategy: PubMed, Scopus, Web of Science, and Google Scholar databases were searched to identify relevant articles. Following key words were used for the search ensuring an extensive search strategy, literature search performed using COVID-19 and coagulopathy related keywords such as "COVID-19", "coagulation factors", "coagulopathy", "thrombosis", "D-Dimer", "coagulation mechanism".Inclusion and exclusion Criteria: In order to assure relevance to recent advances in the understanding of COVID-19 associated coagulopathy, only peer reviewed articles written in English between 2019 and 2023 are taken into consideration. Articles that did not meet the inclusion criteria were also excluded.

Selection of studies: Screening: The titles and abstracts if retrieved papers were examined to determine their relevance to the goal of the study.

Full-text Review: To ascertain eligibility in accordance with the inclusion and exclusion criteria, potentially relevant papers were subjected to a full-text review.

Extracting data: Relevant information about COVID-19-associated coagulopathy, thrombosis risk, population characteristics, study design, and measured coagulation parameters were gathered from a subset of selected studies.The publications that offered significant insights into COVID-19-associated coagulopathy and its clinical consequences are included and served as the foundation for our review and can help to unfold later pathological manifestations. The included papers' references were taken out and subjected to additional examination and analysis. This made it possible to find other information sources and to investigate similar studies that might advance our grasp of the subject matter.

RESULTS AND DISCUSSION

The level of coagulation parameters changes due to the COVID-19 severity (Teimury, Khameneh and Khaledi, 2022). They reported that patients with severe COVID-19 had decreased lymphocytes, reduced platelet count (thrombocytopenia), high fibrinogen and fibrin degradation products (FDP), highly increased D-dimer, higher factor VIII activity, lower factor V and VII activity, elevated PT and APTT, and low antithrombin III (AT III).

To investigate the difference between survivors and non-survivors, coagulation parameters of consecutive novel coronavirus pneumonia (NCP) cases were studied in Tongji Hospital, Wuhan China, and vigorous fluctuations in parameters were traced. They reported the D-dimer range 0.22-21.00 µg/ml and the FDP range of 4.0-150.0 µg/ml and concluded that significantly higher coagulation parameters could be associated with the development of coagulation disorders (Wang et al., 2020).

Analysis of coagulation parameters performed to determine the consumption of coagulation factors and found normal median PT, and APTT but particularly elevated D-dimer (median 450 ng/ml), and mean fibrinogen levels were also above the upper limit. Workers (Martín-Rojas et al., 2020) also observed that 11 out of 206 patients met the criteria for overt DIC (disseminated intravascular coagulopathy) with elevated D-dimer levels (median 2812 ng/ml). Prolonged PT (median 16.5 S), lower platelet count (median 98×103 µl), decreased level of protein C and antithrombin, lower level of factor II, X and XII .

A study (Cui et al., 2020) explored the incidence of venous thromboembolism (VTE) in ICU patients with severe NCP and investigated the difference between VTE and non-VTE patients. Patients with VTE had higher D-dimer, longer APTT, and lower lymphocyte counts, and these parameters were also consistent with those of older patients. Researchers (McFadyen, Stevens and Peter, 2020) reported that, patients with COVID-19 have markedly increased rates of venous thromboembolism (VTE) and pulmonary embolism. In addition, arterial thrombosis, acute myocardial injury, and microvascular thrombosis commonly complicate the condition of patients. Elevated acute-phase reactants such as C-reactive protein (CRP) and fibrinogen and abnormal coagulation parameters such as prolonged APTT, PT, D-dimer, thrombocytopenia (<100×10^9/L) are prognostic markers in COVID-19.

Whole blood samples from 24 COVID-19 patients were analyzed to evaluate parameters by Thromboelastography (TEG), an in vitro device used to assess the viscoelastic properties of native whole blood upon stimulation of hemostasis by an exogenous trigger (kaolin); they concluded that COVID-19 patients show hypercoagulability, which could develop pulmonary embolism or deep vein thrombosis of the lower limbs (Panigada et al., 2020). They also observed other parameters of hemostasis such as normal or slightly prolonged PT and APTT, greatly increased fibrinogen and D-dimer levels, and suggested that patients with COVID-19 do not have DIC; rather they support hypercoagulability together with a severe inflammatory state.

Their findings are also supported by a study (Levi et al., 2020), which reported that patients with COVID-19 coagulopathy not have many hemorrhagic complications and excessive thrombin generation, which is the characteristic feature of DIC. The clinical and laboratory features of coagulation changes in COVID-19 did not match the DIC score of the International Society on Thrombosis and Haemostasis (ISTH). Therefore, they concluded that COVID-19 coagulopathy is distinctly different from DIC. The proportion of abnormalities was higher in the severe group than in the mild group, and significant coagulopathy

was correlated with the degree of disease severity to some extent (Zou et al., 2020). This analysis inferred by studying coagulation parameters in 303 COVID-19 patients in Shanghai, China. The abnormal parameters were fibrinogen in 64.3% patients, D-dimer in 42.6% patients, prolonged prothrombin time in 18.5% patients, abnormal activated partial thromboplastin time in 21.8% patients, and elevated fibrinogen degradation products in 6.3% patients.

The study js also supported by the findings of Abd El-Lateef et al., (2022) who analyzed the differences in coagulation markers and biochemical and inflammatory markers in the severe and non-severe patients and found increased PT, INR, APTT, D-dimer, fibrinogen, C-reactive protein (CRP), factor VIII, VWF and ristocetin cofactor (RiCoF) and decrease lymphocyte count in severe patients but with not any variation in platelet counts.

However, there were significant differences between survivors and non-survivors. All the biochemical inflammatory and coagulation markers were greatly increased in non-survivors, with a decreased lymphocyte and platelet counts. They also found RiCoF was a novel predictor of COVID-19 severity. RiCoF forms complexes with VWF and induces platelet aggregation by conformational change in VWF. Another study by Al Nafea et al., (2023) also depicts coagulopathy associated with severe COVID-19 patients by assessing coagulation profile of survivors and non-survivors and concluded that non-survivors exhibited higher level of D-Dimer (36.8%), PT (31.5%) and PTT (10.5%), demonstrating a strong association between coagulopathy and disease severity.

Coagulation profile of 455 hospitalized COVID-19 patients analyzed in Addis Ababa, Ethiopia, of which 46% showed prolonged PT and variation in INR values. Prolonged PT were more frequent (51.3%) in older people (> 55 years) and males (49.8%) than in females (41%), and 22.1% of total patients had thrombocytopenia. Venous thromboembolism (VTE), arterial thrombosis, and thrombi in vessels of the lung, kidney, and other organs have been reported in critically ill patients with COVID-19 (Araya et al., 2021).

Another study by Larsen, Pasalic and Hvas, (2020) also reported that patients with COVID-19 frequently have minor thrombocytopenia; nonetheless, it is uncommon and should be considered as a sign of either existing or emerging thrombocytopenia when the platelet count is <100×109 /L. They also reviewed the mechanism behind it, which may be adhesion and activation of platelets and this is due to direct influence of virus on hemostasis. In an investigation by Bilaloglu et al., (2020) conducted on 3334 consecutive COVID-19 hospitalized patients, the authors stated that higher D-dimer levels were related to a thrombotic event and that 533 (16.0%) patients experienced such occurrences.

D-dimer level in 119 COVID-19 patients who recovered within the last 6 months were assessed by Lehmann et al., (2021), and elevated D-dimer levels were found in 15% of the patients who had severe COVID-19 that required hospitalization. Of these, when CT scan performed in 79% patients showed elevated D-dimer levels, 13% patients had thrombotic complications. Therefore, D-dimer could be a potential biomarker for post-COVID-19 conditions. Their hypothesis was also supported by another study that assessed the coagulation profile of 75 children below 18 years of age and had confirmed COVID (Di Gennaro et al., 2022).

Tests were performed after 8-12 months of recovery. The coagulation profile of children with post-COVID conditions (PCC) who had at least three or more persisting symptoms compared with the control group of children fully recovered post-SARS-COV-2. They found that the majority of children displayed a coagulation profile that was near normal or within normal range but had significantly elevated D-dimer levels in children with post-COVID conditions compared to those fully recovered from infection.

Mechanism of coagulation activation in patients with COVID-19: COVID-19 coagulopathy also referred to as immuno-thrombo inflammation is the consequence of disturbance of various biological pathways. Mechanisms include an inflammatory response to COVID-19, activation and damage of endothelial cells due to the binding of the spike protein of SARS-CoV-2 with ACE2 receptors on endothelial cells, platelet activation, aggregation, and deregulation of rennin-angiotensin system. Disturbances in these biological pathways leads to various long-term complications, including venous thromboembolism (VTE), disseminated intravascular coagulopathy (DIC), pulmonary embolism (PE), and arterial thromboembolism.

Endothelium is required for normal coagulation, and it is well recognized that endothelial cell destruction induces both intrinsic and extrinsic coagulation pathways, which in turn cause vessel occlusion. Inflammatory responses of COVID-19 such as high levels of interleukin-1 (IL-1), IL-6, tumor necrosis factor (TNF), and other inflammatory cytokines described as a "cytokine storm" alter fibrinolysis and natural anticoagulant pathway and activate endothelial cells, platelets, monocytes and tissue factors (Varga et al., 2020).

Another study (Levi et al., 2020) also found that severely affected COVID-19 patients have cytokine storm profiles characterized by high concentrations of proinflammatory cytokines, such as TNF-α and interleukins (IL-1 and IL-6), which activate coagulation pathway by inducing tissue factor (TF) and inactivating natural anticoagulant pathway. Endothelial cell injury due to this inflammation results in massive release of plasminogen activator, which induces fibrinolytic system, and high concentration of D-dimer and fibrin degradation product (FDP) is detected in patients with severe COVID-19.

Grover and Mackman, (2018) further stated that tissue factor (TF) is the high-affinity receptor for factor VIIa and is expressed on epithelial cells. The VIIA-TF complex activates the extrinsic pathway of coagulation by converting inactive protease factor X into active protease factor Xa. Under pathological conditions, inducible TF can trigger arterial and venous thromboses, leading to disseminated

intravascular coagulation. Another study of Cacciola et al., (2022) found that TF expression in monocytes occurs as a result of proinflammatory cytokine and thrombin production in moderate COVID-19 cohort. They also measured IL-6 and TNF-α levels, which reflect a higher inflammatory state.

Angiotensin-converting enzyme 2 (ACE2) functions as a receptor for SARS-CoV-2 (Varga et al., 2020). ACE2 is expressed on the endothelial cells of heart, kidney, intestine, liver, testis, adipose tissue, and central nervous system. They also stated that endothelial dysfunction causes vasoconstriction, inflammation, and a procoagulant state. This statement is well supported by the study of Escher, Breakey and Lämmle, (2020), who concluded that ACE2 present on endothelial cells are receptors for SARS-COV-2 and responsible for endothelial destruction and release of Von Willebrand factor (vWF) into blood which is stored in Weibel-palade bodies of endothelial cells.

Endothelial cell injury triggers primary hemostasis by activating events, such as platelet activation, aggregation, and adhesion to generate primary platelet plugs (Zhang et al., 2020). ACE2 and transmembrane serine protease 2 (TMPRSS2) are expressed on the platelet surface through which spike protein of virus binds via spike/ACE2 interactions, triggers the release of clotting factors and inflammatory mediators, and generates the leukocyte-platelet aggregates.

Derangement of hemostasis described by a study (Lippi et al., 2021) stated that primary hemostasis is triggered by the binding of SARS-CoV-2 on receptor ACE2 expressed on the surface of endothelial cells. Endothelial injury, followed by activation, adhesion, and aggregation of platelets, generate a platelet plug. This platelet plug is stabilized by fibrin generated by activation of coagulation cascade due to release of tissue factor (TF) from macrophages, and activation of macrophages occurs as a result of cytokine storm characterized by high interleukin values.

They also provided an overview of derangement of fibrinolysis, antiphospholipid antibodies, and renin-angiotensin-aldosterone system and concluded that COVID-19 has developed an immuno-thrombo-inflammatory thrombotic process which is most likely the result of numerous biological pathways, including endothelial damage, macrophage/monocyte activation, and neutrophil activation, which are all made worsened by continuous immobilization and the development of antiphospholipid antibodies.

It has been concluded that SARS-CoV-2 injured the vascular wall of blood vessels by binding with ACE2 expressed on the endothelium. Vascular injury causes vasoconstriction; high expression and secretion of Von Willebrand factor (VWF) promotes platelet aggregation at the site of vascular injury, reduces the expression of thrombomodulin and fibrinolytic heparin, and activates the coagulation cascade.

After the endothelial cells are injured, platelets stick to the vascular proteins, become degranulated, and release prothrombin activator, serotonin, adenosine diphosphate (ADP), and thromboxane A2 for their activation and mechanism of clot formation that start sequentially at the site of injury (Biswas et al., 2021).

Another report of Hess, Eldahshan and Rutkowski, (2020) revealed that angiotensin-converting enzyme 1 (ACE1) and angiotensin II (ATII) contribute to vasoconstriction, proinflammatory, and procoagulation effects. The renin-angiotensin system (RAS) is a hormone system in which angiotensinogen, produced by the liver, is cleaved into angiotensin I (ATI) by rennin secreted from juxtaglomerular cells in the kidney. ACE1 cleaves angiotensin I into angiotensin II. ATII induces tissue factor (TF) and plasminogen activator inhibitor-1 (PAL-1) expression and worsens endothelial function.

By directly cleaving ATII to angiotensin (1-7), ACE2 counteracts the harmful effects of ACE1 and ATII and protects endothelial function. During COVID-19 SARS-CoV-2, the spike protein interacts with ACE2, resulting in the depletion of ACE2. The unavailability of ACE2 favors the action of ACE1/AT2, which leads to a pro-inflammatory and pre-coagulation effect and contributes to endothelial dysfunction, tissue injury, and stroke.

Understanding COVID-19-associated Coagulopathy: A growing number of studies are showing that COVID-19 infection and coagulopathy are significantly correlated. Abnormalities in multiple coagulation measures, such as higher D-Dimer levels, extended prothrombin time (PT) and activated partial thromboplastin time (APTT) are indications of coagulopathy in COVID-19 patients. There exists a definite correlation between abnormalities in blood coagulation and the intensity of the COVID-19 disease. Patients who present with more severe manifestations of the illness tend to display more prominent deviations in their blood clotting measurements when compared to those with milder or moderate symptoms (Lin et al., 2021).

In particular, elevated levels of D-dimer have consistently been associated with greater disease severity and unfavourable clinical outcomes (Yao et al., 2020). This knowledge emphasises how crucial it is to keep updated on coagulation markers in COVID-19 patients in order to determine their risk of thrombosis and to direct treatment decisions. The coagulopathy linked with COVID-19 has complicated several pathophysiological processes.The hypercoagulable state seen in COVID-19 patients is thought to be caused by endothelial dysfunction, virally-induced proinflammatory cytokine release, and deregulation of the host immunological response. Furthermore, endothelial cell invasion by direct infection and coagulation cascade activation raise the risk of thrombosis (Iba, Connors and Levy, 2020).

Clinical Implications of COViD-19-associated Coagulopathy: Significant clinical consequences, such as an elevated risk of venous thromboembolism (VTE),

disseminated intravascular coagulation (DIC), and mortality are associated with coagulopathy in COVID-19 patients. Improving patient outcomes and preventing thrombotic consequences need the early detection and treatment of coagulopathy. Prophylactic and therapeutic anticoagulation have been used as strategies to reduce the risk of thrombosis in COVID-19 patients.

Challenges in Managing COVID-19-associated Coagulopathy: There are still a number of difficulties in managing COVID-19-associated coagulopathy, despite progress in our understanding of its etiology. Clinicians face difficulties in optimising anticoagulant medication due to variation in coagulation profiles, inconsistency in clinical presentation, and a lack of evidence-based guidelines. In addition, worries about bleeding complications linked to strong anticoagulation tactics emphasize the necessity of customized risk assessment and treatment. Studies available in the literature differ in their definitions of disease severity and the measurements used to evaluate outcomes, thereby emphasizing the necessity for standardized criteria to classify disease severity and uniformly assess clinical outcomes across various studies.

Further Direction and Research Implications: Moving forward, more investigation is necessary to clarify the best ways to treat COVID-19-associated coagulopathy. To support evidence-based practice, prospective studies assessing the effectiveness and safety of various anticoagulation regimens as well as the function of novel therapeutic medicines are required. Furthermore, coordinated efforts to standard treatment algorithms and diagnostic criteria would make it easier to provide high quality care to COVID-19 patients who are at risk of thrombotic problems.

Additionally, there is a need to analyze the coagulation profile of recovered COVID-19 patients so that early examination can be used for timely treatment, and early antithrombotic medication for prevention and treatment of thrombosis associated with COVID-19 will lead to enhanced results for recovered COVID-19 patients. The mechanisms that explain the link between blood coagulation abnormalities and disease severity are not fully understood, thus necessitating further investigations into the underlying pathophysiological pathways involved.

CONCLUSION

The literature review acknowledged close link between COVID-19 infection and coagulopathy with elevated coagulopathy markers such as D-Dimer levels, PT and APTT, especially in those patients who experienced severe manifestations of COVID-19 illness. It also underscores the clinical implications related to COVID-19 coagulopathy such as deep vein thrombosis (DVT), venous thromboembolism (VTE), disseminated intravascular coagulation (DIC) and increased mortality. However, there are several challenges in managing COVID-19-associated coagulopathy. Diverse coagulation profiles, uneven clinical presentations, and worries about bleeding side effects from anticoagulant medication are among challenges that clinicians must overcome. In summary, COVID-19-associated coagulopathy poses a serious clinical problem that affects patient outcomes and care. To optimize patient care and guide therapeutic strategies, a thorough understanding of the etiology and clinical symptoms of coagulopathy in COVID-19 patients is essential. In order to lessen the effect of coagulopathy on COVID-19 morbidity and mortality, research efforts must be sustained with the goal of filling up knowledge gaps and improving therapeutic approaches.

ABSTRACT

The present study aimed to compare the two dental age (DA) estimation methods of Cameriere and Demirjian among 6-14 year-old children in Tehran in 2017-2018. This cross-sectional analytical study involved 306 panoramic images from 153 girls and 153 boys. The DA of participants was estimated by Cameriere's and Demirjian's methods. The data were statistically analyzed by the paired sample t-test, repeated measures ANOVA, and the independent t-test. Finally, a formula suitable for Iranian society was developed based on the results of regression analysis. The mean age estimation error was +0.89 years for Demirjian's method (+0.86 in boys and +0.93 in girls) and -0.20 years for Cameriere's method (-0.20 in boys and -0.10 in girls). There was a significant difference between the DA calculated by Cameriere's and Demirjian's methods and the chronological age. There was no significant difference between Cameriere's and Demirjian's methods in this context. The formula developed in this study could estimate the age of participants with an accuracy of above +0.008 (+0.009 in boys and +0.006 in girls). However, the results indicated no significant difference between the proposed formula and Cameriere's method in the accuracy of age estimation.The accuracy of Cameriere's method was higher than that of Demirjian's method, but the formula proposed for Iranian society was more accurate than both of them. The Cameriere method underestimated and the Demirjian method overestimated the age.

KEY WORDS: CHRONOLOGICAL AGE, CAMERIERE'S METHOD, DEMIRJIAN'S METHOD, DENTAL AGE,

INTRODUCTION

Age estimation plays a major role in the diagnosis of endocrine problems 1, forensic dentistry, pediatric dentistry, and orthodontic treatment plans. Age estimation is used by orthodontists in specific orthodontic treatments and by pediatricians for evaluating teeth evolution (increased or decreased) in children with specific diseases. (Feijoo et al 2012, Butti, et al. 2009, Koshy and Tandon 1998, Hauk et al 2001, Graber et al 2012). Time plays an important role in the success of orthodontic treatment. Estimation of DA and skeletal age can help physicians determine the right time to begin treatments. Although there are skeletal and sexual indicators to determine growth rate, dental indicators are more commonly used for this purpose because they are less affected by nutritional and endocrine status, especially in children and adolescents, (Mani et al 2008, Molina et al 2020).

It has been shown that there is a relationship between dental calcification stages and skeletal development. DA is determined through Andrade et al (2019) methods: (1) assessing teeth growth in the oral cavity, and 2) examining tooth formation stages in X-rays. The first method is limited to children who haven't reached mixed dentition, and is affected by factors like premature tooth loss, ankylosis, or dental arch stenosis. Consequently, the second method is preferred for its broader applicability and reliability, (Baccetti et al 2005, Andrade et al 2019).

Developed in 1973, Demirjian's method is one of the most widely used methods in measuring dental development. Demirjian et al (1973) studied 7 permanent teeth on the left

side of the mandible from 2928 panoramic radiographs of 3-16-years-old Canadian-French people and then developed a table of indicators and a conversion table. To solve the previous problems, Demirjian et al. (1973) increased the number of samples to 2047 boys and 2349 girls. They classified the course of dental development (from dental bud to completion) under 8 stages named A through H, (Demirjian and Goldstein 1976). Cameriere et al. (2006) proposed a novel age estimation method based on their study of 213 boys and 242 girls in Italy, which aimed to determine age by examining the relationship between age and the diameter of dental apices. The studies have shown that the age estimated by this method is very close to chronological age, (Rai et al 2006, Camerie et al 2007, 2008).

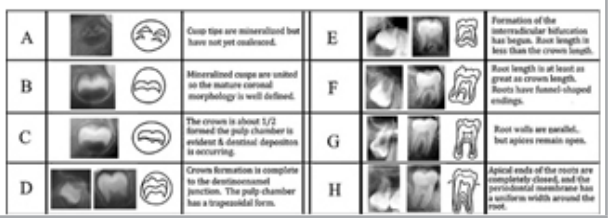

Figure 2: Measurement of dental length and width in Cameriere's metho

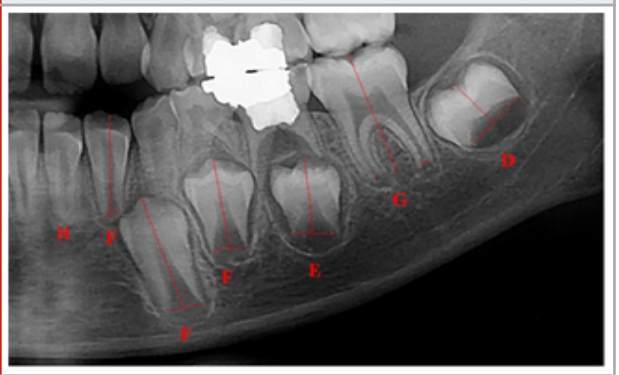
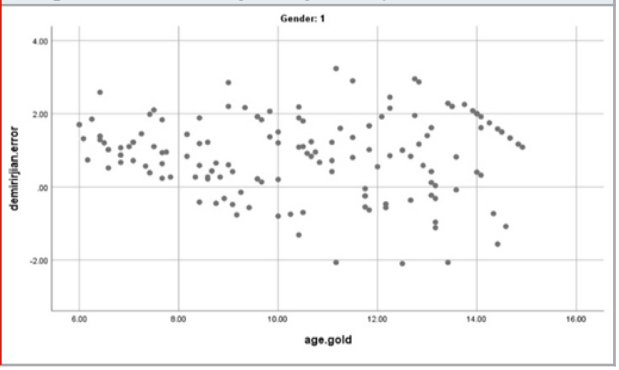


Scatter plot 1: Estimation error of Demirjian's method compared to chronological age in boys



According to the literature, the course of dental development varies in different populations (even between different cities of a country) at different times. 16 These differences may be attributed to genetic or environmental factors such as socioeconomic status, nutrition, diet, and lifestyle or changes that occur over time in populations, (Marjatta et al 1988, Leurs et al 2005).The purpose of the present study was to compare dental age (DA) estimated through Cameriere's and Demirjian's methods with chronological age within the population aged 6-14 years in Tehran during 2017-2018. Additionally, the study aimed to develop a formula for this specific population using a regression equation.

MATERIAL AND METHODS

In this study, 306 panoramic radiographs of 6-14-years-old patients were collected from 4 oral and maxillofacial imaging centers in Tehran. The images were taken from March 2017 to June 2018. The inclusion criteria were as follows: Patients without developmental defects and systemic diseases affecting the growth. Panoramic images of high quality without any distortion. Patients with no missing teeth. Patients with a known date of birth. Lack of environmental factors affecting calcification such as inflammation or injury at the site. To begin, the chronological age of participants was determined by subtracting the radiography date from their date of birth, recorded with precision to two decimal places. Then participants were categorized into nine age groups, each spanning a one-year interval, with an equal number of participants across all age groups and both genders. Digital radiographs were taken using Cranex D (Finland, Helsinky, Sordex) and Planmeca (Finland, Helsinky, Planmeca).

Demirjian's method for age estimation was performed by 3 persons (two trained senior dental students and an oral and maxillofacial radiologist). In case of disagreement between the two observers, the radiologist's opinion was recorded as DA.According to Demirjian's method, 7 permanent teeth on the left side of the mandible were evaluated based on the course of dental development, which will be explained below (Figure 1). Then the table of indicators was used to give a number to each tooth considering its developmental stage (Table 1).

Finally, the 7 numbers obtained were added up to calculate the total maturity score, which ranges between 0 and 100. This score was converted into DA using the relevant tables and then compared with chronological age. To determine the error rate of Demirjian's age estimation method, the obtained DA was subtracted from chronological age. If DA was greater than chronological age, the values were reported with a positive mark. Otherwise, they were recorded with a negative mark.To estimate DA by Cameriere's method, images were opened in Adobe Photoshop-2018 to match them in terms of size and resolution.

All images were observed and evaluated in a 13.3-inch screen MacBook Air 2017 (1440 × 900) and Intel HD Graphics MB 1536, 6000 graphics. Then the images were measured by two observers. In case of significant disagreement, the measurement was repeated by a radiologist. In Cameriere's method, the 7 permanent teeth on the left side of the mandible were measured as explained in the following formula:

$$\text{Age} = 8.971 + 0.375\ g + 1.631\ X_5 + 0.674\ N - 1.034\ S - 0.176\ N.S$$

In single-rooted teeth (A_i, i=1…5), the distance between the inner wall of open-apex teeth was measured. In multi-rooted teeth, the mean distance between the inner walls of both roots (A_i, i=6,7) was separately calculated, and added up and then the length of the teeth was measured.

To neutralize the effects of magnification and X-ray angle, the dimensions were normalized by dividing them by the length of the tooth (L_i, i=1…7) ($X_i = A_i/L_i$ = 1…7). Moreover, the number of fully developed closed-apex teeth in each participant was counted and recorded as N0.

Finally, the normalized sum of the number of open-apex teeth (X_i), the number of open-apex teeth (S), the number of closed-apex teeth (N0), and gender (0 for girls and 1 for boys) were inserted into SPSS.To estimate age by Cameriere's method, all variables (N0, SN0, g, X_1, X_2. X_9) were defined and put in formulas proposed by Cameriere for Italian society. The obtained figure was subtracted from chronological age to calculate the estimation error.Based on the estimation error of Cameriere's method, a formula was developed for Iranian society. To this end, a regression equation was considered with age as the dependent variable and N0, SN0, S, X_1. X_7, and gender as independent variables. According to stepwise regression, variables N0, X_1, X_3, X7, SN0, and gender remained in the model, and the following regression line equation was obtained: Age = $9.309 + 0.636\ g - 3.852\ X_1 - 2.505\ X_3 - 1.007\ X_7 + 0.664\ N - 0.265\ SN0$

To reduce estimation error, the observers were unaware of the participants' age in both methods. In addition, the chronological age of participants was obtained by subtracting the radiography date from the date of birth.

Data analysis: Statistical analyses were performed in SPSS 24. Repeated measures ANOVA and the independent t-test were employed to compare the two studied methods in terms of the absolute value of estimation error and compare the absolute value of estimation error in girls and boys, respectively. Also, the DA obtained from Cameriere's and Demirjian's methods was compared with chronological age (overestimation or underestimation) by the paired sample t-test. *Demirjian. error: Demirjian's method error / ** Demirjian.error.abs: absolute value of Demirjian's method error,*Cameriere. error: Cameriere's method error / ** Cameriere.error.abs: absolute value of Cameriere's method error.

RESULTS AND DISCUSSION

The research involved the analysis of 306 panoramic images, comprising 153 girls and 153 boys aged between 6 and 14 years. The participants were divided into different age groups, each spanning a one-year interval, with each age group consisting of 17 boys and 17 girls.

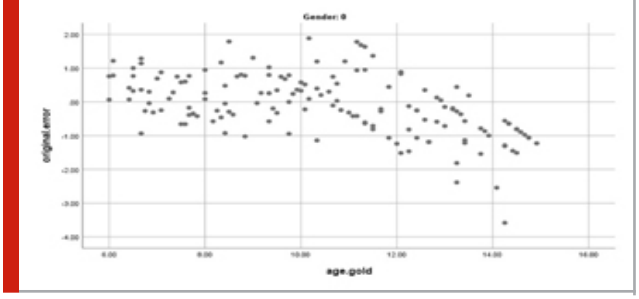
The results of repeated measures ANOVA for investigating the accuracy of Cameriere's and Demirjian's methods in the estimation of participants' chronological age are shown in Table 2. As shown in Table 2, Demirjian's method overestimated chronological age by 0.89 years, on average (0.86 in boys and 0.92 in girls). The absolute value of the mean estimation error for this method was 1.12 years (1.15 in boys and 1.09 in girls). Furthermore, Table 2 indicates that Cameriere's method underestimated chronological age by 0.20 years, on average (0.29 in boys and 0.10 in girls). The absolute value of the mean estimation error for this method was 0.75 years (0.79 in boys and 0.71 in girls).

Table 3 presents the results of the paired sample t-test to investigate the degree of overestimation or underestimation of age by Cameriere's and Demirjian's methods. The results showed that the DA estimated by both Cameriere's and Demirjian's methods was significantly different from chronological age ($p>0.05$). The results obtained from the formula proposed in this study are shown in Table 4. Based on Table 4, our formula underestimated chronological age by 0.0008 years, on average (0.0009 in boys and 0.0006 in girls). The absolute value of the mean estimation error for this formula was 0.71 years (0.76 in boys and 0.67 in girls).

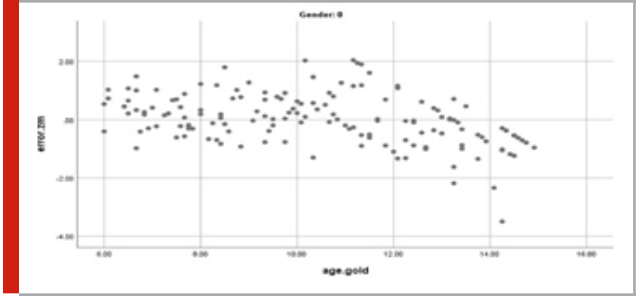
Table 5 shows the results of comparing Cameriere's and Demirjian's methods and our formula in terms of mean error and their absolute values for both boys and girls. Based on this table, the highest and the lowest estimate errors were related to Demirjian's method in boys and the

formula developed in this study in girls, respectively. The highest accuracy of Demirjian's method and Cameriere's method was observed in the age group 8-9 years and age group 7-8 years in both sexes, respectively. Moreover, the highest accuracy of the formula developed in this study was related to the age group 6-7 years in boys and 7-8 years in girls. The three above-mentioned methods have been compared with each other in the estimation error in scatter plots 1 through 6.

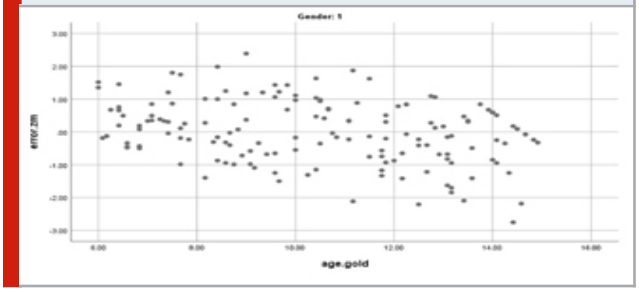
Scatter plot 4: Estimation error of Cameriere's method compared to chronological age in girls



Scatter plot 5: Estimation error of Mohammadi's(proposed formula) method compared to chronological age in boys



Scatter plot 6: Estimation error of Mohammadi's(proposed formula) method compared to chronological age in girls



When the absolute values of the estimation error of the three methods are compared, it can be concluded that there is a significant difference between Cameriere's method and Demirjian's method ($p<0.05$) and also between the formula developed in this study and Demirjian's method ($p<0.05$). By contrast, there was no significant difference between the formula developed in this study and Cameriere's method in this regard ($p>0.05$). The results of the independent t-test indicated no significant difference between boys and girls in terms of the absolute value of the estimation error of all methods ($p>0.05$).

Various methods with different accuracies have been proposed to evaluate the evolution of dental structure, such as Demirjian, Cameriere, Smith, Willems, and Haavikko, (Demirjan et al 1973, Cameriere, et al 2008, Haayiikko 1974 Smith 1991).

This study aimed to investigate the accuracy of Cameriere's and Demirjian's methods in DA estimation from panoramic radiographic images in the Iranian population and to propose a formula suitable for Iranian society. The results showed that the DA estimated by both Cameriere's and Demirjian's methods was significantly different from chronological age in the studied Iranian population ($p<0.05$). The results also indicated that the estimation error of Demirjian's method was higher than that of Cameriere's method. The mean absolute value of estimation error was 1.1 years in Demirjian's method and 0.7 in Cameriere's method. The estimation error of both methods was observed in both genders and all age groups ($p<0.05$).

Demirjian's method overestimated DA in both genders and all age groups, whereas Cameriere's method underestimated DA in all age groups of girls but overestimated in the age group 6-10 years. Cameriere's method followed no specific pattern, as it overestimated DA in age groups 6, 7, and 10 years but underestimated DA in other age groups.

Previous studies have reported that the estimation error of Demirjian's method compared to chronological age ranged between 0.13 and 0.97 years in girls and between 0.09 and 0.98 years in boys, (Grover et al 2011, Sakhdari, et al 2015, Wolf et al 2016, Pinchi et al 2016, Apaydeen et al 2018, Ginzelová et al. 2015, Mohanty et al 2019, Ali et al 2019).

However, some studies have shown that Demirjian's method underestimates DA, (Alqadi et al 2019, Lan et al 2019), as it ranges between 0.15 and 1.03 years in girls and between 0.04 and 0.89 years in boys (Table 6). It seems that the results of DA estimation by Demirjian's method do not follow a clear pattern in different populations. Most studies conducted on Demirjian's method in Iran reported that this method overestimates DA compared to chronological age, Javadinejad, 2015, Shaeikhi et al 2019), the latter conducted two similar studies on children aged 5-16 years in Babol and Rasht. Their results demonstrated that Demirjian's method underestimated DA by 0.04 years in Babol but overestimated DA by 0.02 years in Rasht compared to chronological age, (Shaeikhi et al 2012, 2013). This discrepancy can be attributed to ethnic, environmental, nutritional, and socioeconomic differences as well as differences in sample size and statistical analysis.

After Cameriere carried out a study on a large European population and developed a formula for DA estimation in 2006, different studies reported different results of age estimation by this method. 15, 22-24, 39, 42 Cameriere (2006) stated that the accuracy of his method was -0.11

years 12. In the present study, the mean accuracy of Cameriere's method in age estimation was obtained at -0.20 years (-0.11 years in girls and -0.29 in boys). Various studies have shown that the estimation error of Cameriere's method is less than that of chronological age. These studies have reported that the estimation error of Cameriere's method ranges between 0.08 and 0.96 years in girls and between 0.07 and 1.07 years in boys, (El Bakery 2010, Kumaresan 2014), (Table 6).

Table 1: Dental indices in each stage for girls and boys

Tooth		A	B	C	D	E	F	G	H

demirjian.age - chronological.age	0.89706	0.99261	0.05674	0.78540	1.00872	305	0.000

It can be stated that previous studies have reported different accuracies for Cameriere's and Demirjian's methods; some studies have shown that Demirjian's method is more accurate than Cameriere's method, (Wolf et al 2016, Pinchi et al 2012, Timmins et al 2011), whereas other studies, like the present study, concluded that Cameriere's method is more accurate, (Timmins et al (2011), Javadidenaj 2015).

Some studies have stated that the accuracy of Cameriere's or Demirjian's methods is higher in a certain age group. For example, (Bagherpour et al. 2010, and Javadinejad et al.

2015, and Timmins et al 2011) showed that the accuracy of Demirjian's method was higher in age groups 9-13, 6-11, and 16 years, respectively. Timmins et al. (2011) also reported that Demirjian's method was more accurate for older ages. This discrepancy may be attributed to racial, socioeconomic, and nutritional differences as well as differences in sample size.A comparison of the absolute values of the mean estimation error in this study showed that the highest accuracy of Demirjian's method was observed in age groups 8-9 and then 7-8 years in both genders and the highest accuracy of Cameriere's method was related to the age group 7-8 years in both genders.

The accuracy of Cameriere's method in different age groups has been measured in different studies, (Galic et al 2010, Javadinejad et al. 2015, da Luz et al (2019). Consistent with the findings of the present study, Javadinejad et al. (2015) reported that Cameriere's method was more accurate in girls aged 6-11 years and boys aged 6-12 years.

In addition, Da Luz et al. (2019), Golsahi et al. (2015) and Rivera et al. (2017), showed that the highest accuracy of Cameriere's method was observed in people aged 8, 9, and 13 years, respectively. Galic et al. (2010) stated that the highest accuracy of Cameriere's method was related to the age of 15 years in boys and 12 years in girls, (Galic et al 2010). Available studies have reported that DA of boys is higher than girls in children aged under 8.5 years, whereas dental development is faster in girls in children aged 9-12 years. This can be attributed to the fact that girls reach puberty at this age, (Feijoo 2012, Halilah 2018).

In this study, the DA of boys aged under 9 years was about 0.2 years more than DA of girls of the same age. By contrast, the DA of girls was more than boys by 0.45 and 0.53 years in children aged 10 and 11 years, respectively. However, these differences were not statistically significant.

Previous studies have generally reported that both Cameriere's and Demirjian's methods underestimate DA at older ages and overestimate DA at younger ages, (Liversidge 2010 Guo et al (2014). There are various reasons for DA underestimation at older ages. One of the main reasons is that all teeth have developed and there are a few teeth with non-developed roots or lately-developed roots in children of this age group. The number of developing teeth decreases as people grow older, and only the third molar remains non-developed by the age of 14 years, Liversidge 2010).

One of the reasons for the different results in different studies is the choice of different age ranges. According to available radiology references, since surgical and orthodontic treatments are not usually recommended in patients aged under 6 years (except for emergency cases), it is preferable to perform radiology and treatment at the same time, (White and Pharaoh 2014). When the apex of the distal root of the second molar is closed in children, the course of dental development is considered to be accomplished. Since the third molar is not investigated in most methods of DA estimation for children, these methods select the age of 14 years as the end of the studied age range. In the present study, the age range of participants was 6-14 years.

However, the findings of previous studies suggest that Demirjian's method can be used for age estimation before puberty. Accordingly, if the second molar, canine, and the first premolar teeth are at F, F, and E stages, respectively, it can be stated that one is in the pre-pubertal phase (equivalent to phases CS1 and CS2 in cervical vertebrae cervical maturation). When vertebral and dental development phases are compared, it can be also concluded that girls reach puberty at the age of 12 years, which is equivalent to Stage G in the second premolar, (Tafakhori et al 2016).

Various methods of DA estimation are used to predict the beginning and completion of orthodontic treatments. In cases where there is a delay in tooth eruption, we can use the patient's radiograph and compare the conditions of each tooth with the standard conditions to predict the time of tooth eruption. Demirjian and Levesque stated that a tooth is about to erupt if it is at Stage G but it takes about one year to erupt if it is at Stage F. They also suggest that if a permanent tooth is at Stage F, the deciduous tooth covering it should be extracted., Levesque et al (1980).

Chronological age estimation based on Cameriere's formula will have the least error in Iranian society when the obtained figure is added to 0.2. Moreover, to maximize the accuracy of Demirjian's method, 0.87 should be subtracted from the figure obtained from this formula.

Considering the estimation error obtained for Cameriere's formula in this study, a domestic formula was designed in this study based on Cameriere's formula to suit the Iranian population. The designed formula was as follows:

$$Age = 9.309 + 0.636\ g - 3.852\ X_1 - 2.505\ X_3 - 1.007\ X_7 + 00.664\ N - 0.265\ SN0$$

Compare the developed formula with Cameriere's formula:

$$Age = 8.971 + 0.375\ g + 1.631\ X_S + 0.674\ N - 1.034\ S - 0.176\ N.S$$

Where, the dental index was considered to be 5 (X_5), and teeth 1, 3, and 7 (X_1, X_3, and X_7) were replaced.

Some previous studies have developed population-specific formulas for age estimation. However, the accuracy of the developed formulas is not always more than that of Cameriere's method. Hallilah (2018) argues that this is due to the unequal number of samples in different age groups. This discrepancy was also observed in the present study despite the acceptable number and uniform distribution of samples in different age groups.When the formula developed in this study is compared with Cameriere's and Demirjian's methods, it can be concluded that the accuracy of the formula developed in this study was higher than that of the other two methods ($p<0.05$). Hence, researchers are recommended to use this formula in studies conducted on Iranian populations.

Some of the limitations of these methods that can cause differences in results are as follows: Those who have a missing tooth cannot be included in the study. Cameriere's method requires the measurement of open-apex teeth. This is difficult to do in teeth where the apex is closed. Conduction of studies on people of different age groups or genders can lead to a discrepancy in results. Nutritional, social, and economic issues can affect the course of dental development, (Timmins et al 2011). There is a difference between races and ethnicities in terms of the rate of dental development, (Shaikhi et al 2013).

Although the panoramic technique has many advantages, slight changes in the X-ray tube angle or patient position (the object is places a bit backward or forward in the focal trough) can cause dimensional changes in the resulting images, (Tafakhori et al 2016). Considering technological advantages, age estimation methods are recommended to be based on the use of cone beam computed tomography (CBCT), as this method has been used in recent studies, (Kazmi et al 2019, Molina et al 2020).

CONCLUSION

Both Cameriere's and Demirjian's methods are not highly accurate and the DA estimated by them is significantly different from chronological age. However, the study findings revealed that Cameriere's method was more accurate than Demirjian's method. The formula designed in this study for Iranian society was more accurate than both of the above-mentioned methods. All three methods had almost the same accuracy in both genders. However, Cameriere's method underestimated the age, and Demirjian's method overestimated the age compared to the chronological age.

ABSTRACT
Hornbills are large sized fruit eating birds important in forest ecosystems as they help in natural forest regeneration through seed dispersal. Thus they also help in forest ecosystem resilience. In the vast and iconic forests of Central India, Malabar Pied Hornbill *Anthracoceros coronatus* is perhaps the largest frugivore bird species and therefore plays a vital role in maintaining broadleaved forest ecosystems in the region. To better understand this role played by MPH, we studied its diet at Pench Tiger Reserve, MadhyaPradesh during the non-breeding and breeding seasons during a span of two years, i.e., January 2021 to December 2022. It was found that MPH consumed fruits belonging to 22 plant species during the non-breeding season (August to February); and fruits belonging to 32 plant species were consumed during the breeding season (March to July). Overall, fruits belonging to 11 fig species and 26 non-fig plant species were taken in both seasons. Fruits belonging to the *Moraceae* family were the most preferred among all plant species in the hornbill diet. Eleven plant species belonged to Moraceae, two each to Euphorbiaceae and Anacardiaceae, and the rest to other families like the Annonaceae, Ebenaceae, Boraginaceae, etc. The diet also included animal matter including insects, crabs, scorpions, mollusks, frogs, geckos, lizards, birds, eggs, chicks, squirrels, bats and rats. These were supplied by male hornbills to nest inmates during breeding the season. Of the 11 fig species, *Ficus benghalensis* was the most preferred, followed by *Ficus religiosa*; and among non-fig plants, *Putranjiva roxburghii* was most consumed by A. *coronatus*, possibly because of its fruiting during both the breeding and non-breeding seasons. On average, male paid 10 visits to the nest per day. In the post-hatching period, the frequency of the supply of animal matter was found to increase with the maximum supply of insects and their larvae in the months of June and July.

KEY WORDS: MALABAR PIED HORNBILL, ANTHRACOCEROS CORONATUS, DIET COMPOSITION, FOOD PREFERENCE, PENCH TIGER RESERVE, MADHYA PRADESH, CENTRAL INDIA.

INTRODUCTION

Hornbills are among the conspicuous arboreal birds in the old-world tropical forest. Generally, they are frugivorous but can adapt themselves to an omnivorous diet in the breeding season (Poonswad etal., 1986; Kemp, 1993). India has nine species of Hornbills but only two species, Indian Grey Hornbill and Malabar Pied-Hornbill regularly occur in Central India. Both may play important roles in maintaining forests in the region, but Malabar Pied Hornbill *Anthracoceros coronatus* (MPH) may be especially important as seed dispersers given their larger size . According to the IUCN Red List (2022), MPH is listed as "Near Threatened" (Criterion NT C1) due to decreasing trends in its population because of poaching, deforestation, habitat loss and fragmentation. A. *coronatus* prefers deciduous forest and thick canopies with distinct distributional ranges, i.e., Western Ghats, Eastern Ghats, and some pockets of Satpuda mountain range in Central India.

The species is frugivorous (Ali and Ripley 1987, Reddy et al. 1990), occurring in mixed deciduous and riparian forests (Reddy et al. 1990) and moist deciduous (Ali and Ripley 1987) forests. During the non-breeding period (May to February), 60% of the diet consisted of figs alone (P. Balasubramanianet.al. 2004).

There are some anecdotal observations about the sympatric Indian Grey Hornbill *Ocyceros birostris*, like by Kasambe

and Pimplapure (2007), Kasambe (2012), Patil, et. al (1997), and Neelakantam (1953). Newham (1911) had reported Indian Grey Hornbills Ocyceros birostris feeding on young parakeets. However, Santhoshkumar and Balasubramanian (2015) as well as Kasambe, et. al (2017) did comprehensive research on the diet of Indian Grey Hornbill O. *birostris* in Nagpur (Maharashtra) and in Eastern Ghats (Tamil Nadu) Fig species were the most important component of the diet. Hornbills preferred red and purple fruits over the other colors, and they preferred large, heavy fruits over smaller fruits (Suer Suryadi et. al 1994). This study relates the fruit utilization of hornbill species to the abundance and availability of food resources.

Study Area: Pench Tiger Reserve is situated in the districts of Seoni and Chindwara of Madhya Pradesh close to the border of Pench Tiger Reserve in Maharashtra state. This Tiger Reserve covers an area 757.920 sq. Km. and lies between 210 38' to 210 50' 30" N and 790 9' to 790 22' 03" E. The forest types found in the area are classified as the Sub-tropical Hill Forest, the Tropical Moist Deciduous Forest, and the Lush Green Deciduous Forest (Champian and Seth, 1968). The Central Indian Highlands have a tropical monsoonal climate, with a distinct monsoon (July to September), winter (November to February) and summer (April to June).

The mean annual rainfall is around 1400 mm, with the south-west monsoon accounting for most of the rainfall in the region. The Reserve lies in the southern lower reaches of the Satpura Range of hills on the southern border of Madhya Pradesh. The general topography of Pench Tiger Reserve is mostly undulating, characterized by small ridges and hills having steep slopes, with a number of seasonal streams and nullahs carving the terrain into many folds and furrows, a result of the folding and upheavals of the past.

MATERIAL AND METHODS

The study was conducted from January 2021 to December 2022. Standardized survey were conducted in the morning (0600-0900 h) and evening (0400-0600 h) when hornbills are most easily detected. To understand the diet composition and food preferences in the non-breeding season, the visual scanning method was used. For the breeding season, a camera trap was mounted near the nest cavity, besides collecting the midden (which includes excreta, regurgitated seeds and other dropped food items) from below the three active nest cavities. Observations about the fruiting phenology were taken.

Three active nests were monitored for collecting information on feeding by male hornbills and the feeding observations were recorded by Cuddeback Camera Trap installed at the nests. The excreta, regurgitated seeds and other dropped food items were collected in collection plastic bags twice a week from under the nests. The seeds collected from the midden were dried and stored in perforated plastic containers. Fruit size and weight was recorded using a caliper and a weighing balance. Data Analysis was done by using Excel and PAST software.

RESULT AND DISCUSSION

Diet composition of Malabar Pied Hornbill: This study focused on the fruit and animal matter consumed by *A. coronatus* in the non-breeding (August-February) and breeding (March to July) season. The study revealed that *A. coronatus* feeds on both fruit and animal matter but the quantity of animal matter eaten was found to be more during the post breeding period which was said to be taken as a protein supplement for growth the young ones.

Fruit diets: We found that MPH fed on fruits of 38 plant species. They were found to eat fruits of more plant species during the breeding season (32 species) than the non-breeding season (22 species). The 38 plant species are from 21 families, and Moraceae was the most preferred family among all plant species in *A.coronatus* diet (Table 1, Graph 1, Graph 2). Data was also analyzed for fruits types, like drupes, achenes, pods etc.

It was found that in the non-breeding season among all plant species in the diet, achenes were 45%, drupes 36%, pods 9% capsules and aggregate fruits were 5%. Whereas in the breeding season the diet composed of drupes 36%, achenes 32%, barriers 16%, capsule 7%, aggregate fruit, follicle and pods were 3% each. It means that in non-breeding season achenes (45%) forms major chunk of its diet while in breeding season drupes (36%) were dominant in the diet.

Balasubramanian, et. al (2004) studied the food habits of Malabar Pied Hornbill *Anthracoceros coronatus* in the Western Ghats, India. They found that figs formed the top three preferred food species throughout the year; 60% of the diet was figs during the non-breeding period (May to February), whereas during the breeding period (March and April), 98% per cent of food deliveries to nest inmates were fruits belonging to six species. These included a high share of figs (75.6%). Santhoshkumar and Balasubramanian (2015) reported that food items delivered at the nest included both plant (63.7%) and animal matter (36.3%).

In the diet they found 83% fruits and the rest were leaves (8.8%), insects (7.7%), and flowers (0.5%). Of the 38 fruit species being taken, *Ficus* spp. constituted 25.3% of the non-breeding season fruit diet. Kasambe et. al (2017) found that that for the Indian Grey Hornbill *Ocyceros birostris*, the keystone diet species of food were figs of Sacred Fig *Ficus religiosa* (53.84%) and Banyan *F. benghalensis* (22.82%). Thus, in the diet of the *Ocyceros birostris* 76.66% constituted of figs of these two species during the breeding season.

Kanitha Ouithavon (1999) said that fruit food in the families Lauraceae, Annonaceae, Myristicaceae and Meliaceae were consumed by the sympatric hornbills in high quantity. These families comprised 95 % of these fruit diet of the Rufous-necked Hornbill *Aceros nipalensisand* about 41 % of the fruit diet of the Great Hornbill *Buceros bicornis*. They hypothesized that these fruit families have a high nutrient value, especially lipid content, that was necessary for hornbills. Snow (1981) stated that most of the tropical fruits eaten by birds were lipid-rich, but temperate fruits eaten by

birds had a high water content and were carbohydrate-rich. White (1974) states that some species of tropical fruits such as figs have high carbohydrate and available energy, but low lipid content. Figs collected in the study area had a lot of agaonid wasps inside them. Abrahamson (1989) explains that figs themselves have low protein, but presence of agaonid wasps through their long co-evolution means that figs are in fact a rich source of protein and calcium.

This was in accordance with Poonswadet.al, (1998) who found that the Great Hornbill consumed figs more than any other fruit except for *A. indica*, all the above-mentioned tree species form part of riparian vegetation. Fruit species consumed in large quantities- *Ficus belgalansis*, and *Putranjiva roxburghii* were abundant. *Putranjivi roxnburgii* plant species was found abundantly along the side of Pench River as well as on the islands in the river during food preference plant species survey in the study area (Graph 5).

The range of fruit weight and size consumed by *A.coronatus* was 0.13-23.2gm and 5-37.8 cm in diameter respectively (Table 2). Data was also analyzed as per the fruiting phenology of the plants, and we found that most of the plant fruit ripening season was in Mach to June, coinciding with the breeding season of *A.coronatus.*

Animal Diet: As Kemp (1995) and Poonswad (1998), mentioned the hornbills of the genus *Aceros* are known to drop down on the forest floor along the stream sides is not just for quenching its thirst but apparently to catch crabs, small fish and others. As per concern with the animal matter total 26 kinds of animal matter belongs to 8 groups were delivered by *A. coronatus* in breeding period. Among these 8 animal groups, Arthropods include beetles, grasshoppers, caterpillars, moths, butterflies, dragonflies, spiders, crabs); molluscs(snails), amphibians (frogs), reptiles (lizards, geckos, skinks, *Varanus*), birds (Black Drongo, Jungle Owlet, parakeet, Green Pigeon, White-breasted Waterhen, Jungle Babbler and bird chicks), white and blue coloured bird eggs, and mammals (squirrels, bats, rats), (Table 3, Graph 6).

Rinchen Wangchuk et. al. (2017) said that Rufous-necked Hornbill *Aceros nipalensis* feeds on both vertebrate and invertebrate animal species that includes 13 animal species such as crabs, bird chicks, beetles, caterpillars and even small mammals like squirrels, rats, as recorded at the nesting sites, information gathered through the questionnaire survey with the local people and feeding observation data and regurgitated seed collected samples. Fruit species were eaten throughout the year while animal matter was eaten usually after the hatching period to supplement the dietary requirement of the chicks for growth and the mother for the rejuvenation of her health.

Out of 8 animal groups 34% was covered by arthropods, 4% molluscs, 4% amphibians, 17% reptiles, 27 % birds, 4% bird eggs, 11% mammals and 4% unidentified animal matter. Pawar et al. (2018), reported thirteen kinds of animal matter that included eggs, invertebrates such as moths, stick insects and mantis, and vertebrates such as frogs, skinks, snakes, rodents, and small birds in the diet of *Buceros bicornis*. In total, for all the nests, 128 animals were delivered during519 hours of observations. The Rhinoceros and Great Hornbills in this study had been seen consuming giant millipedes, a food item that has been reportedly used as sealing material (Kemp 1995).The Great Hornbills prefer an insect diet once the chick has hatched(Golding and Williams 1986). The absence of a chick may account for the lack of protein-rich food such as animal matter, being delivered by the male to the nest site. The female Great Hornbill in this study spent between 56 - 87 days in the nest cavity before abandoning the nest, exceeding the average 40-day incubation period of the Great Hornbill (Poonswad and Kemp 1993). Due to the absence of protein foods in its food deliveries, the assumption was that no eggs had hatched.

CONCLUSION

The present study concluded that among 38 plant species, the 11 were fig species and *Ficus benghalensis* was the most preferred, followed by Ficus religiosa, and among non-fig plants, *Putranjiva roxburghii* was most consumed by *A. coronatus*, possibly because of its fruiting during both the breeding and non-breeding seasons. Non-fig species are more numerous than fig species. Even though it has been determined that the Moraceae family was preferred over other families, we hypothesized that Moraceae members have higher nutritional value than other fruiting species. On average, male paid 10 visits to the nest per day. First visit was paid at at 05:30 am and last visit was at 6:30 pm.

In the pre-hatching and hatching periods, delivery of lizards, geckos, and squirrels was more prominently observed, white and blue coloured egg was delivered by the male. More blue eggs were delivered by the male than white eggs and these blue eggs were identified as those of babblers. Apart from that, in the post-hatching period, the frequency of the supply of animal matter was found to increase with the maximum supply of insects and their larvae in the months of June and July (Monsoon).Finally study concluded that all the animal food consumed by the *A.coronatus* is totally dependent upon the availability of animals in the month of breeding season and the efforts made by the male to capture the small animal.

ACKNOWLEDGEMENTS

Sincere appreciation must be extended to the Forest Department, Madhya Pradesh for granting permission for our research in Pench Tiger Reserve. We are also grateful to Madhya Pradesh Biodiversity Board, Madhya Pradesh for their financial assistance to this work. We would like to thank all the field members Mr. Mithlesh Shirsam, Mr. Sumit Ambulkar, Mr. Pratik Chaudhari and special thanks to Mr. Shubham Wagh for his efforts toward study area map designing. We also very thanks full to Principal Dr. G. V. Korpe for their continuous support and encouragement.

Identification and Characterization of Amylolytic Bacteria from Agro-industrial Waste Water

Soumya Nandi* and Annalakshmi Chatterjee
Laboratory of Food Chemistry and Microbiology,Food & Nutrition Division
Department of Home Science. University of Calcutta. Kolkata-700027.

ABSTRACT

Introduction: Looking for novel amylases needed for industrial processes may benefit from the screening of microorganisms with high amylase activity. Microbial enzymes are widely used in industrial processes due to affordable cost, significant production, chemical stability, environmental protection, plasticity, and widespread availability. Since Purba Bardhaman contains numerous rice processing plants and agro-industrial waste disposal locations, water samples were gathered for the study. Material & Methods: Amylase-producing bacteria were isolated, identified and revealed from this work to add new knowledge into the field of science. Seven bacterial isolates were isolated, and based on appearance of zone of hydrolysis in starch agar plates was selected for further study. The isolate was Gram-positive, spore-forming rods. Depending on 16s rRNA gene sequences with 99.79% similarity the isolate was identified as *Brevibacillus parabrevis*, efficient amylase producers with an excellent yield throughout the solid-state fermentation technique. The isolate demonstrated maximum enzyme activity of 350 U/mg at 5% substrate concentrations. This piece of work focuses on finding out whether agro-industrial waste water could be a better source for amylolytic bacteria.

KEY WORDS: AGRO-INDUSTRIAL WASTE WATER, AMYLOLYTIC BACTERIA, BIOCHEMICAL CHARACTERIZATION, SCREENING.

INTRODUCTION

Microbial population can be manipulated to yield enzymes which are commercially important in organic compound synthesis, clinical analysis, pharmaceuticals, detergents, food production and fermentation. Microorganisms can easily be targeted as economical source for industrial enzyme production. Use of cheap, easily accessible wastes, such as agro-industrial waste, as a novel substrate for production and synthesis of amylase for industrial use is an ongoing effort that helps to address pollution issues. Amylase, an enzyme, is needed for the catalytic degradation of starch into its monomeric elements, of which glucose is the smallest, (Logeswaran et al.2014, Saha et al.2019).

Looking for novel amylases needed for industrial processes may benefit from the screening of other microorganisms with high amylase activity. Microbial production of amylase is more fruitful than other sources like plants or animals, because of short growth period, biochemical diversity and simplicity with environmental and genetic manipulation could improve the capacity for enzyme synthesis, Mishra and Behera (2008), Saha et al (2019). In order to substitute enzymes, which are typically extracted from complex eukaryotes because to their biochemical diversity and the ease with which enzyme concentrations may be increased by environmental and genetic manipulation, attempts are now being explored, (Bole et al.2013). Microbial enzymes are widely used in industrial processes due to affordable cost, significant production, chemical stability, environmental protection, plasticity, and widespread availability, (Mishra and Behera 2008, Deb et al.2013, Burhan et al.2003).

Approximately 25% of the enzyme market is comprised of amylase enzyme. Fungi and bacteria are the best choices of the source because they are very economical with high production rate and can be genetically engineered for the desired quality and quantity of amylase production, (Islam et al 2017). In biotechnological applications ranging from food fermentation, detergent, pharmaceutical, brewing, and textile to paper industries, amylases perform a significant role, (Kathiresan and Manivannan 2006). Low-cost amylase production is necessary to meet the greater demands of these sectors, (Saxena and Singh 2011). Earlier, amylase production has been studied using submerged (SmF) and solid-state fermentation (SSF), Perez-Guarre et al. (2003), Saxena and Singh (2011).

However, as the elements of a synthetic medium are very costly and uneconomical, they must be substituted with agricultural and industrial waste products, which are thought to be a viable source for microbial populations that produce enzymes and are more readily available. In this present experimental work, isolation and screening of amylase producing microbes has been attempted with samples collected from rice processing units in Bardhhaman, West Bengal. Since these areas are rich in rice processing units and agro-industrial waste, therefore, data of this work might contribute new insights into finding cheaper sources for amylase producing microorganisms. This process was achieved by stepwise activities including isolation of α-amylase producing microorganisms from the waste water sources; selection and identification of the most potent isolate for in-vitro enzyme production while utilizing the solid media; and optimization of culture conditions affecting α-amylase production by the selected isolates.

MATERIAL AND METHODS

Isolation of microorganism: Waste water sample was collected from agro-industrial dump of rice processing unit of Purba Bardhaman, West Bengal India. The study region is situated at 23°15'15.3"N, 88°01'50.9"E latitude and longitude. Water sample was collected by using sterile containers and was stored in 4ºC for subsequent analysis. As the water sample was collected from the dump area of rice processing unit, there might be presence of amylolytic microorganisms so selective media along with basic media was used for isolation of microbes. 0.1 mL of every specimen has been put into nutrient agar plates from the container. (Beef extract 10g/L; Peptone 10 g/L; Sodium Chloride 5 g/L; Agar 15 g/L; pH 7.2±0.1) as well as starch agar plates (Beef extract 3 g/L; Peptone 5 g/L; Soluble starch 10 g/L; Agar 15 g/L; pH 7.2 ± 0.1) in triplicate. After that, the microbial culture was spread using spreader and maintained for 24 hours at 37°C. Colonies were cultured on the proper medium after the incubation time to generate pure isolates, and were then kept at 4°C for more study.

Screening of microorganism: The pure microbial culture obtained was cultured on starch agar plates to authenticate whether the microbial culture obtained was amylolytic bacterial species. After 24 hours of incubation, the plates were immersed with iodine solution for 30 seconds. Clear zones encircling the growth of microbes were considered to be amylase producers.

Characterization and identification of amylase producing isolates: The isolates were assessed by the gram reaction and colony morphology, respectively using the methods of Collins and Lyne. Collins et al.(2004), Sinha. (2010). Additionally, other biochemical assays such as IMViC Test, Urease test, and Starch hydrolysis tests, sugar fermentation, nitrate reduction test were from carried out to characterize isolates in terms of their biochemistry. As the sample was collected from waste water so coliform test was also carried out. 16s rRNA gene sequences was also carried out for authentication of the species and genera of the microbes. Saitou and Nei, (1987).

Standardization of substrate concentration and incubation period for enzyme production: Substrate concentration for enzyme production was optimized using different concentrations of starch (1.0, 2.5, 5.0, 7.5 and 10.0%) with different incubation period of time (24, 48, 72, 96 and 120 h) in the production medium.

Amylase production by using Solid State Fermentation (SSF): After standardization of the substrate concentration and incubation period, the SSF process was carried out using rice husk. Substrate bed (Rice Husk: 10 g, Starch: 0.5 g, KH_2PO_4: 0.2 g, NaCl: 0.25 g, $MgSO_4$, $7H_2O$: 0.02 g, $CaCl_2$:0.1 g, $(NH4)_2SO_4$: 0.1 g) was prepared and transferred into 250 mL capacity Erlenmeyer flasks. Moisture content was adjusted with 20 mL de-ionized water and autoclaved and allowed to cool to room temperature. 10 mL of 24 h old microbial cultures was added into the substrate medium and incubated for 96 h, (Tsegaye et. al.2014).

Extraction of crude enzyme: The extracellular enzymes from the fermented substrate were extracted using phosphate buffered saline (50 mL) after proper agitation on a rotary shaker at 120 rpm for 45 minutes. The content was filtered and squeezed through a cotton cloth. The filtrate was used as the crude enzyme, Tsegaye et. al. (2014).Determination of enzyme activity: Activity of α-amylase was determined by 3,5 Di-nitro salicylic acid (DNSA) method, Miller (1959) using Potato Starch as substrate and Sodium Phosphate buffer (pH-6.9) as the incubation medium at 37°C of incubation temperature. Total protein content was determined, Lowry et al (1951).

RESULTS AND DISCUSSION

Isolation & Screening of Microorganism: As a result of the preliminary screening, many isolates having the capacity to synthesize amylase at different levels were identified. Seven potential microbial isolates were obtained from the waste water samples were marked as Sp1-Sp7 depending upon their growth on nutrient agar as well as clear zone formation in starch agar media after reacting with gram's iodine solution (Table-01) and this outcome was consistent with the findings of Hmidet et. al. (2009) from the starch hydrolysis test, Sp1 was selected for further investigation.

Table. 1: Bacterial Isolates with their clear zone on Starch agar

Bacterial Isolates	Clear Zone(mm)
Sp1	25.0 ± 0.5
Sp2	10.0 ± 0.1
Sp3	17.0 ± 0.2
Sp4	15.0 ± 0.6
Sp5	8.0 ± 0.1
Sp6	4.0 ± 0.9
Sp7	1.5 ± 0.3

Characterization of amylase producing isolates

Colony Morphology: The most potent isolate that showed highest starch hydrolyzing ability was selected for further characterization. The isolate was characterized based on colony growth feature and microscopic observation (magnification of 100X and 400X) to distinguish their respective genera. Sp1 demonstrated a regular form, with color and rod shape of colony morphology (Table-02).

Table. 2: Colony morphology of the Isolates

Bacterial Isolates	Clear Zone(mm)
Characteristics	Bacterial Species (Sp1)
Configuration	Round
Margin	Entire
Elevation	Raised
Surface	Smooth
Density	Opaque
Pigmentation	White
Gram reaction	Positive (+ Ve)
Cell morphology and spore	Rod shaped and Oval

Effect of different physico-chemical factors: Effect of different physico-chemical factors like temperature, pH and salt concentration (NaCl) was also observed. As per observation the microbial culture is adaptable to a vast range of temperature from 20ºC-45ºC with optimum growth at 37ºC. The isolated microbes are capable to grow even in lower salt concentration (2%) even at lower water activity i.e. xerophile in nature.

Biochemical Characterization: Based on the biochemical characterization (Table-03) isolate may be *Brevibacillus* sp. Depending on the isolate's initial screening, these genera might be suitable for commercial applications, which the previous report corroborated by Ashwini et al. (2011).

16s rRNA gene Sequencing: The best amylase producing bacteria was isolated and identified by amplification and sequencing of its 16s rRNA full length coding gene, following the comparison of the obtained sequence with the NCBI database using the BLAST tool. The result showed that the selected stain was closely to Brevibacillus gene and in particular to the species parabrevis with 99.79% similarity. Therefore, the newly isolated strain was named as *Brevibacillus parabrevis.* 18109.

Standardization of substrate concentration & Incubation period for enzyme production: Fermentation conditions need to be optimized, especially with regard to physical and chemical characteristics, Wenster-Botz (2000). Amylase activity generally increased while starch concentration increased from 1.0% to 10.0%. In this investigation, 5% of starch content provided the maximum activity (Figure-02) at different incubation time. The present finding is also endorsed with previous investigations on amylase activity, as reported by Oyeleke and Oudwole (2009). At 96 hours into the fermentation procedure, the isolate's amylase activity reached its peak, after which it began to drop (Figure-02). *Bacillus subtilis* and *Bacillus* sp. DLB9 has also exhibited comparable outcomes, Shyam et al.(2013).

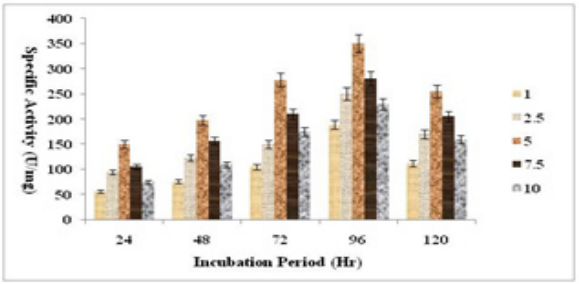
Determination of potential enzyme activity: The crude enzyme isolated from Sp1 showed the maximum specific activity of 350 U/mg, the current results are consistent with past reports obtained from Bacillus species, Bukhari and Rehman (2015).

Figure 2: Standardization of Substrate Concentration & incubation Period



The experimental piece of work was focused on obtaining microbial isolates from agro-industrial waste water having the ability to produce amylase. Many microbial species have already been identified as good amylase producers. Studies of amylases from bacteria and fungi are well available but using a cheaper resource for microbial isolation has not been documented. In our study, seven microbial isolates were identified from the five different waste water samples collected from the rice processing units. Though most of the isolated microorganisms are potent producer amylase but depending upon the starch breaking capacity of amylase produced by the microorganisms on starch agar media, Sp1 was selected for further investigation. Being neutrophilc in nature the microbe is adaptable to live in an environment where the hydrogen ion concentration is at equilibrium i.e. thrives in a relatively neutral pH, in the range of pH 5-9.

Even in lower salt concentration, the isolated microbe is capable to grow, which indicates its xerophilic nature. With 99.79% similarity, the isolated microbial stain was closely related to the Brevibacillus genus and in particular to the species parabrevis, potential candidates with several industrial applications for amylase production. Generally, the amount of amylase activity increased as the starch concentration rose from 1.0% to 10.0% with maximum activity at 5% concentration, but when excludes 5% concentration, amylase activity decreased. This might be because the isolates have the ability to metabolize starch within a short amount of time after the concentration was raised. The isolate showed maximum amylase activity at 96 h. The suppression and presence of other byproducts in the fermentation medium as well as a reduction in nutrients may be the causes of the amylase activity decline after 96 hours, Haq et al (2010), Gebreyohannes (2015).

CONCLUSION

The present study attempts to explore the potential of indigenously microbial isolates from easily available cheap source that are capable to produce amylases. The current findings bring about a decision that the agro-industrial waste water possesses the potential to be a source of amylase-producing microbes that might be used to create highly effective industrial amylases. The present study is the first-time report on the capability of alpha amylase producing activity by *Brevibacillus parabrevis*. The isolated bacterial species that showed higher amylase activity can be characterized and exploited further for various useful industrial applications.

ABSTRACT
Nanoparticles are a revolutionary medication delivery technology, as we all know. They have several positive impacts, such as the drug's efficacy and safety. We enumerate its efficaciousness during drug distribution in this review. One of the methods for more precisely delivering pharmacological substances to the intended tissue while lowering the total dosage and possible harmful side effects is drug nanoformulation. They may function as carriers of various active medicinal ingredients into a particularly body regions, or they may be therapeutic agents in and of themselves. As a truly multidisciplinary field of study, nanotechnology has benefited greatly from the contributions of chemists, physicists, biologists, and pharmaceutical scientists in the development of novel therapeutic and diagnostic approaches. The application of nanotechnology has advanced non-invasive imaging, nutraceutical delivery, cancer and HIV/AIDS treatment, and more. This review makes it clear that the use of nontechnology in medicine and drug delivery has created new avenues for individualized and secure treatment options. In the end, researchers are able to administer medications for longer periods of time with less frequent doses (sustained release), higher precision, and penetration in difficult-to-access tissues through the alteration of molecular size and surface features.

KEY WORDS: NANOPARTICLES, LIPOSOMES, NANOFORMULATION. DRUG DELIVERY,

INTRODUCTION

Polymeric particles made of synthetic or natural polymers, known as nanoparticles, are spherical in shape. Their sizes vary from 10 to 500 nm. These particles offer a wide range of possible uses due to their spherical form and high surface area to volume ratio. Nanoparticle size and surface characteristics have been studied to improve bioavailability, reduce clearance, and boost stability. By regulating these properties, the medication can now reach bodily tissue that might not have previously been reachable. Nanoparticles are divided into several categories based on their size, shape, and material qualities (Haleem et al., 2023).

Furthermore, nanoparticles can be hard (such as titania [titanium dioxide], silica [silica dioxide] particles, and fullerenes) or soft (such as liposomes, vesicles, and nanodroplets). The classification of nanoparticles often relies on their use, such as in diagnosis or therapy vs fundamental research, or it may be connected to how they were generated. They have also aided in the development of new techniques of administering treatment, such as giving local warmth (hyperthermia), limiting vasculature to sick tissues and tumors, and transporting medication payloads (Al-Abduljabbar & Farooq 2023).

Magnetic nanoparticles have been used to trace the progression of cancer along lymph nodes in place of radioactive technetium. The nanoparticles function by taking advantage of the contrast change caused by microscopic particles of superparamagnetic iron oxide in magnetic resonance imaging (MRI). Such particles can also be utilized to eliminate tumors by hyperthermia, which involves heating and destroying tissue on a small scale using an alternating magnetic field (Crintea et al., 2022).

Nanoparticles can be created to improve fluorescence imaging, positron emission tomography (PET), or ultrasound pictures. These strategies often need the nanoparticle's

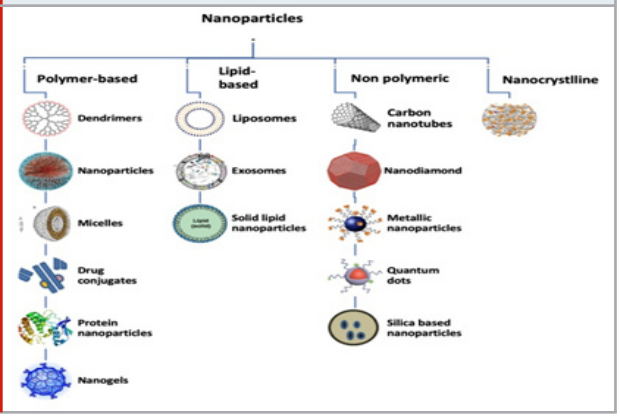
ability to recognize a certain cell or disease condition. The medication might be delivered by a nano capsule or a liposome, or it could be delivered in a porous nano sponge structure and then kept in place by bonding at the targeted spot, allowing for delayed drug release. The creation of nanoparticles to help with medicine delivery to the brain by inhalation offers great potential for the treatment of neurological illnesses such as Parkinson's, Alzheimer's, and multiple sclerosis (Jain et al, 2018).

Figure 1: Types of Nanoparticles.



Nanoformulations: Nano formulation of drugs is one strategy to deliver pharmaceutical agents more precisely to the targeted tissue and reduce the overall dose and potentially toxic side effects (Choi et al., 2023). Types of nano formulations: Nanocrystal: Nanocrystals have been utilized to deliver insoluble medicines like paclitaxel. PEGylation is a critical idea that extends the circulation duration of the nanocarrier system and enhances medication therapeutic outcomes (Sun et al., 2008). Nanocapsule: This has the potential to increase medication stability and bioavailability. Peptides, hormones, proteins, enzymes, medicines, metabolites, or reporter molecules may be protected from biological and chemical degradation using nano capsules (Janeth et al., 2017).

Nanospheres: Nanospheres are used in anti-wrinkle creams, moisturizing creams, and anti-acne nanoparticle creams. Nanospheres are utilized to transport active ingredients deeper into the skin, as well as to preserve the active component from enzymatic or chemical destruction or to provide a regulated release. In the case of scents, this delivery mechanism was found to extend active release (Prieto et al., 2017).

Nanosponges: They can solubilize weakly water-soluble medicines, resulting in extended release and improved medication bioavailability. The two primary therapeutic applications for nanosponges are targeted drug delivery (ensuring that the medicine reaches the target cells in the body, such as cancer cells) and enhanced drug delivery, which allows for improved physical qualities of pharmaceuticals (e.g., solubility)Nanoprecipitation: This technique involves quickly injecting a drug solution into an aqueous phase after it has been dissolved in a water-miscible organic solvent. Drugs precipitate quickly in aqueous media, forming nanoscale drug particlNano Formulation Based on Emulsions: Preparing an oil-in-water or water-in-oil emulsion and then letting the solvent evaporate to produce nanoparticles is known as solvent evaporation. [16] It includes phase inversion and spray drying (Sun et al., 2022).

Coacervation: In this method, a polymer solution is phase separated into a coacervate phase, which contains the medication. Upon solidification of the coacervate phase, nanoparticles may develop.

Electronspinning: Electrospinning is mainly used to manufacture nanofibers, but with the right formulations, it can also be utilized to produce nanosized particles.

Technology of Supercritical Fluids: Supercritical Antisolvent Process: To precipitate nanoparticles from a solution, antisolvents such as carbon dioxide are employed at supercritical temperatures. [20] Supercritical Fluid.

Extraction of Emulsions: In order, to extract nanoparticles from an emulsion, supercritical fluids must first be generated.

Nano carriers used in nanoformulation: Materials known as nano carriers are made with the purpose of encapsulating and delivering medicinal medicines, imaging agents, or other payloads in a precise and regulated way. These carriers play a crucial role in nanoformulations, improving medication stability, bioavailability, and solubility while frequently enabling tailored administration (Marianna Foldvari 2010). The following are a few typical nano carriers found in nanoformulations.

Liposomes: Lipid bilayers form the spherical vesicles known as liposomes. In their lipid bilayers or aqueous core, they can contain hydrophilic or hydrophobic medications, respectively. Liposomes can be used for a variety of medication delivery applications because they are biocompatible and adaptable (Zhang et al., 2018).

Polymeric nanoparticles: Biocompatible and biodegradable polymers are used to create polymeric nanoparticles. They can be made to release medications gradually or under strict supervision. Chitosan nanoparticles and poly (lactic-co-glycolic acid) (PLGA) nanoparticles are two examples.

Micelles: Made up of amphiphilic molecules, micelles are self-assembling structures. When these molecules are present in concentrations higher than their critical micelle concentration (CMC), they form. Drug distribution can be improved when hydrophobic medications are dissolved in the center of micelles.

Nanocapsules: Having a core-shell structure, nanocapsules are nanoscale capsules. Drugs can be accommodated in the core, while proteins, polymers, or lipids are frequently found in the shell. It is possible to encapsulate both hydrophobic and hydrophilic molecules using this architecture.

Dendrimers: Having a distinct structure, dendrimers are highly branching macromolecules. Their size and surface

functionality can be precisely controlled during their synthetic process. Drugs or imaging agents are frequently encapsulated inside of dendrimers.

Solid Lipid Nanoparticles: Solid Lipid Nanoparticles (SLNs) are room-temperature, lipid-based nanoparticles in a solid state. In comparison to conventional liposomes, they provide better stability and regulated release. Drugs can be shielded from deterioration by the lipid matrix. Protein-based.

Nanoparticles: Drug delivery nanoparticles can be formed from proteins, such as albumin or gelatin. These protein-based carriers can be engineered to have particularly targeting characteristics and are biocompatible.

Carbon nanotubes: Therapeutic compounds can be carried via carbon nanotubes, which are cylindrical structures with special features. Functionalized carbon nanotubes can be used as delivery systems for different payloads, such as imaging agents or drugs (Ganesh et al., 2015).

Metal nanoparticles: As carriers, metal nanoparticles derived from gold, silver, or iron oxide can be employed. Their surfaces can be functionalized for drug loading or targeting, and they may possess special features.

Cyclodextrins: Cyclodextrins are cyclic oligosaccharides that have ability to combine with hydrophobic medications to form inclusion complexes that increase the solubility of the former. They can serve as drug delivery vehicles, particularly for medications that are not very soluble in water (Patel et al., 2020).

Applications of nano formulation: Applications for nanoformulations can be found in many different domains, and they provide benefits like focused therapy, increased therapeutic efficacy, and better drug distribution. It includes1) Drug Delivery 2) Targeted Drug Delivery 3) Sustained Release 4) Cancer Therapy 5) Imaging and Diagnostics 6) Vaccines 7) Gene Delivery 8) Cosmetics & Personal Care 9) Agriculture 10) Food and Nutraceuticals 11) Wound Healing 12) Environmental Remediation To guarantee safety, scalability, and regulatory compliance in these applications, however, further research is necessary.

Methods used to improve drug delivery in nano formulation: One of the most important facets of pharmaceutical research and development is enhancing medication delivery. A range of techniques and tools are used to improve medication delivery's effectiveness, safety, and specificity. Here are some essential techniques for enhancing medication delivery.

Nanotechnology: Using nanoscale carriers to encapsulate medications, such as liposomes, micelles, polymeric nanoparticles, and dendrimers. This improves stability and solubility and enables tailored distribution.

Systems of Lipid-Based Delivery: Lipid vesicles known as liposomes are capable of encasing medications that are hydrophilic or hydrophobic. They enhance the stability and solubility of drugs and can help with targeted distribution. Lipid-based nanoparticles with regulated drug release and improved bioavailability are called solid lipid nanoparticles (SLNs) and nanostructured lipid carriers (NLCs).

Delivery Systems for Polymers: Polymeric Nanoparticles: Nanoparticles for controlled medication release can be made from biodegradable and biocompatible polymers and targeted delivery.

Polymeric Micelles: Amphiphilic block copolymers self-assemble to generate self-assembling structures that improve the solubility of hydrophobic medicines.

Drug Pairs: Prodrug Design: The process of chemically modifying pharmaceuticals to produce prodrugs that, in their original form, are inactive or less active. In vivo activation enhances medication delivery and stability. Drugs and antibodies are linked to create antibody-drug conjugates (ADCs), which are then specifically delivered to target cells, such cancer cells. Encasing medication particles in microspheres or microcapsules to prevent deterioration and enable regulated release is known as microencapsulation.

Targeted Administration of Medicines: Active targeting is the process of delivering drugs to the intended location on cells by utilizing ligands, such as peptides or antibodies, to target particular receptors. Using the enhanced permeability and retention (EPR) effect in tumors, where leaky blood arteries allow nanoparticles to enter the body, is known as passive targeting. Using the increased permeability and retention (EPR) effect in tumors—where leaky blood arteries enable nanoparticles to aggregate preferentially in malignant tissues—is known as passive targeting.

Microneedle Technology: Transdermal drug delivery by microneedles allows for regulated release of medication by avoiding the epidermal barrier.

Electrospinning: This technique produces nanofibers that are used in tissue engineering, medication delivery, and wound healing.

Ultrasound-mediated delivery: The process of using ultrasound to improve drug penetration into tissues or cells, is referred to as ultrasound-mediated delivery.

Microfluidics: Using microfluidic devices to carefully manage the formulation process to produce nanoparticles or microcapsules with desired qualities is known as microfluidics.

Magnetic Drug Delivery: To improve targeted drug delivery, magnetic nanoparticles are guided to precise places using magnetic fields. Creating responsive systems that release medications in response to particularly stimulus, such as pH, temperature, or enzyme activity, is known as "smart drug delivery."

Routes of administration for nanoformulation: The drug's properties, the intended site of action, and the

intended therapeutic outcome all influence the delivery method selection.

The following are some typical medication delivery pathways for nanoformulations: Oral Administration, Intravenous Administration, Transdermal Delivery Intramuscular and Subcutaneous Injection Inhalation, Intrathecal and Intraventricular Administration, Intraperitoneal Administration, Ocular Delivery, Nasal Delivery, Delivery via Vagina and Rectal, Intradermal Delivery& Intraperitoneal Delivery. The advantages and disadvantages of each administration route are taken into consideration, while designing nanoformulations in order, to maximize drug delivery for certain therapeutic uses.

Factors that improve drug delivery in nano formulation: By using nanoscale carriers to address issues with drug solubility, stability, and targeted distribution, nanoformulations aim to improve drug delivery. The following elements influence how well drugs are delivered in nanoformulations.

Greater Surface Area: When compared to traditional formulations, nanoformulations offer a noticeably larger surface area. Better interactions with biological systems are made possible by the increased surface area, which enhances medication distribution and absorption.

Better Solubility: Hydrophobic medications' poor solubility is addressed via nanoformulations. Drug solubility and bioavailability are improved when drug particles are reduced to the nanoscale because this improves the effective surface area exposed to the surrounding medium.

Improved Bioavailability: Rapid drug absorption and distribution are made possible by the tiny particle size and larger surface area of nanoparticles, which enhances bioavailability. This is crucial for medications whose oral bioavailability is limited

Long-term Sustained and Controlled Drug Release: Drugs can be released over an extended period of time with the use of nano formulations. This controlled release profile enhances patient compliance, lowers adverse effects, and maintains therapeutic medication levels.

Targeted Drug Delivery: Certain tissues or cells can get drugs in a targeted manner thanks to nano formulations. While passive targeting can be accomplished by the increased permeability and retention (EPR) effect in some pathological circumstances, such as tumor tissues, active targeting is facilitated by surface modifications using ligands or antibodies.

Protection of Drugs: Liposomes and nanoparticles are examples of nanocarriers that can shield pharmaceuticals from enzymatic or adverse environmental degradation. During transportation and storage, this protection improves the stability of medications.

Better Cellular Uptake: Drugs that have trouble crossing cell membranes can benefit from nano formulations, which can improve cellular uptake. It is possible to use a variety of methods, such as receptor-mediated endocytosis, to help drugs enter target cells.

Decreased Side Effects: In nano formulations, targeted medication administration and controlled release help to minimize off-target effects and lower systemic toxicity. This is especially helpful for cancer treatment and other illnesses where accurate medication localization is essential.

Biocompatibility: To guarantee that nano formulations are compatible with biological systems, biocompatible materials are frequently used in their creation. This lowers the possibility of negative reactions and raises the medication delivery system's safety rating.

Customized Surface Properties: By altering their surface, nanoparticles can be made to exhibit particularly characteristics like greater target cell contact, enhanced stability, or stealth behavior—a lower capacity to be recognized by the immune system.

Multifunctional Platforms: By combining therapeutic pharmaceuticals with imaging or diagnostic agents, nano formulations can function as multifunctional platforms. This allows for simultaneous diagnosis and therapy.

Administration Ease: Based on the demands of the patient and the properties of the medicine, nano formulations can be created for a variety of administration routes, such as oral, intravenous, transdermal, or inhalation. This flexibility in drug delivery allows for customized treatment plans. These variables must be carefully taken into consideration, keeping in mind the unique characteristics of the medication and the intended therapeutic objectives, so nano formulations to be applied successfully.

Nano formulation improving drug delivery: The following are some ways that drug distribution can be enhanced by nanoformulations.

Enhancement of Bioavailability: Poorly water-soluble medications can become more soluble thanks to nanoformulations, which increases their absorption and bioavailability. Better absorption of medications is made possible by the protective action of nanoparticles against gastrointestinal tract degradation.

Targeted Administration of Medicines: Targeting particularly tissues, cells, or organs with functionalized nanoparticles can minimize off-target effects and enhance therapeutic results. Adding ligands to targets is known as active targeting. Attaching ligands to the nanoparticles that enable them to identify and bind to certain receptors on target cells is known as active targeting.

Prolonged Release: Drugs can be released from nanoformulations in a regulated or sustained manner, resulting in a longer duration of action and fewer dosage adjustments.

Defence of Pharmaceutical Molecules: Drugs can be more stable in biological settings by using nanoparticles to shield them from enzymatic or chemical processes that could break them down.

Delivery Within Cells: Drugs can be delivered intracellularly more easily with the help of nanoparticles, reaching their intended locations inside cells.

Diminished Adverse Reactions: By limiting the amount of time, medication is exposed to healthy tissues, targeted delivery can lower the likelihood of adverse consequences.

Combination Counselling: Co-delivery of several medications is made possible by nanoformulations, which enables combination therapy with beneficial effects.

Diagnostic Imaging: Nanoparticles can be employed as diagnostic instruments for illnesses or as imaging agents to see how drugs are distributed throughout the body.
Personalized Health Care: Personalized medicine can be advanced by customizing nanoformulations to each patient's unique set of traits.

Non-intrusive Administration Routes: As an alternative to more conventional delivery methods like oral or intravenous injection, nanoparticles can be engineered for non-invasive routes like transdermal or nasal distribution.

Cells/Tissues helping in drug delivery: Different cells and tissues can be used or targeted in medication delivery to improve the safety, effectiveness, and selectivity of medicinal medicines. The following tissues and cells are frequently used in medication delivery.
The inner surface of blood arteries is lined with endothelial cells. It is possible to create nanoparticles to get through the endothelium barrier and deliver them specifically to particularly tissues or organs.

Macrophages: As a component of the immune system, macrophages can be used to carry drugs, particularly to inflammatory regions. It is possible to engineer nanoparticles such that they are specifically delivered to areas of infection or inflammation and are absorbed by macrophages.

Hepatocytes, or liver cells: Because the liver is involved in drug processing, it is frequently the target of drug delivery methods. It is possible to engineer nanoparticles so that they gather in hepatocytes, which would improve the administration of medications that the liver must metabolize or be used to treat liver illnesses.

Cancer Cells: One of the main goals of medication distribution is to target cancer cells. In order to minimize side effects, nanoparticles can be functionalized to recognize and deliver medications to cancer cells only, sparing healthy cells.

Immune cells: Vaccines and immunotherapies can be developed specifically targeting immune cells, such as dendritic cells. Antigens or therapeutic substances that elicit an immune response can be delivered using nanoparticles.

Central Nervous System (CNS) Cells: The blood-brain barrier makes it difficult to transfer drugs to the brain. It is possible to create nanoparticles that can get through this barrier, making the treatment of neurological conditions easier.

Skin Cells: Transdermal drug administration delivers medications locally or systemically by targeting the skin. Drugs can be progressively released from nanoparticles by making them able to permeate the layers of skin.

Bone Cells: Osteoporosis and bone cancer can be treated by targeted medicine delivery using nanoparticles to the bone tissue.

Mucosal Cells: Local medication administration or systemic absorption can be directed towards mucosal surfaces, such as those found in the respiratory and gastrointestinal systems. Through mucosal barriers, medication absorption can be improved by nanoparticles.

Tumor Vasculature: Drug delivery strategies can target the distinct features of blood arteries found within tumors. It is possible to engineer nanoparticles so that they selectively collect in tumor blood arteries, enhancing medication delivery to the tumor.

Red Blood Cells: To improve distribution to particularly organs and extend circulation periods, drug-loaded nanoparticles can be encapsulated or adhered to red blood cells.

Lymphatic System: Drug delivery to lymph nodes and tissues connected to the immune response is made possible by the ability of nanoparticles to specifically target the lymphatic system.

Synovial Cells: To administer anti-inflammatory medications to synovial cells in the joints, such as in rheumatoid arthritis, nanoparticles can be specifically targeted to these cells. Through the utilization of distinct cell and tissue properties, scientists can create drug delivery systems that optimize therapeutic effects while reducing side effects. In order, enhance patient care, the discipline of nanomedicine is still investigating novel strategies for targeted drug delivery.

CONCLUSION

This review makes it clear that the use of nontechnology in medicine and drug delivery has created new avenues for individualized and secure treatment options. In the end, researchers are able to administer medications for longer periods of time with less frequent doses (sustained release), higher precision, and penetration in difficult-to-access tissues through the alteration of molecular size and surface features. There are many benefits to using micro and nanoparticles in biomedicine, particularly when it comes to drug delivery, over traditional methods which include

improved drug delivery, high-performance properties of the product, using less costly drug concentrations in the delivery systems, extending the drug's bioactivity by shielding it from environmental effects in biological media, and more effective treatment with fewer side effects.

On revealing the Hidden Richness of Fish Diversity from Melghat Region of Maharashtra, India Using DNA Barcoding : A First Approach

Vaishnavi S Kuralkar and Gajanan A Wagh
Biodiversity Research Laboratory, Department of Zoology, Shri Shivaji Science College, Amravati, Maharashtra, 444603 India.

ABSTRACT

The increasing loss of biodiversity globally has led to numerous proposals to intensify efforts to produce a census of all biological diversity and to modernize taxonomy. Over the years, a steady decline has been observed in the abundance and diversity of native fishes in the rivers due to anthropogenic disturbances. The present study was carried out on fish diversity from the major rivers and their tributaries in the Amravati district including the Melghat landscape in Maharashtra. The study was conducted from December 2022 to May 2024. Muscle and fin tissue was collected onsite by following standard protocols to avoid contamination. In this study, a total of 46 species belonging to 36 genera, 16 families, were DNA barcoded using the mitochondrial cytochrome c oxidase subunit I (COI) gene. All of the fish species were discriminated by their COI sequences, showing deep genetic divergence, and were highlighted for further taxonomic investigation. Average Kimura 2-parameter genetic distances within species of families like Channidae, Cyprinidae, and other families 0.75%, 0.82%, and 0.97% are respectively. These values show that COI divergence increases as taxa become less exclusive. Devario aequipinnatus from the family Cyprinidae showed the highest overall GC content at 40.00% , Oreochromis mossambius from the family Chhichlidae had the lowest 28.57% indicating the divergence in the nucleotide composition of fishes. All of the COI sequences obtained were grouped according to their species designation in the maximum likelihood tree that was constructed using MEGA 11 software. This study demonstrated that DNA barcoding has great potential as a tool for fast and accurate species identification and also for highlighting species that warrant further taxonomic investigation.

KEY WORDS: COI, DNA BARCODING, FRESHWATER FISHES, TAPI, WARDHA, PURNA, AMRAVATI DISTRICT, MELGHAT.

INTRODUCTION

Fish account for approximately half of all vertebrates with 34,300 species identified worldwide. Approximately 7.7% of the world's fish are in India, with 994 species classified as freshwater and 1,673 as marine. Sustainable management of genetic resources requires an awareness of fish species taxonomy and systematics. At present many species have become extinct to Indian origin, there is an urgent need to develop a tool to describe all the earth's species so that the associated societal and economic benefits can be derived in addition to evolving strategies for protecting fishes and conserving the resources they constitute). When differentiating between cryptic species of adult fish and larval fish, morphology is not as effective as DNA barcoding, (Krishna et.al. 2012 Shelake etal 2021).

However, DNA barcoding has the potential to identify specific species. The research area's cryptic species, species composition, and several unclear species may all be quickly surveyed using the DNA barcode technology, which can also be used to identify physically similar species (Ko et al. 2013). Applications for barcoding have a great deal of potential appeal in the fishing industry. The authentication of species in fisheries is becoming increasingly dependent on genetics (Ardura et al 2013). DNA barcoding, which is supported by Hebert et al. (2003a, 2003b), aims to make it easier to recognize the growing number of taxa that are unfamiliar in biological conservation and biodiversity surveys. The 652 base pair target DNA fragment regarding fishes is highly suggested to be located close to the 5′ ends of the mitochondrial cytochrome oxidase subunit I gene (Zhang et.al. 2011).

DNA barcoding's main objectives are to create reference libraries of barcode sequences for recognized species so that trustworthy molecular tools for identifying species in the wild can be created (Hubert et. al. 2008). Numerous marine and freshwater fish have benefited from the technology's application. In addition to successfully classifying unknown specimens into recognized species, DNA barcoding is an emerging method for species identification that can also identify genetically distant populations. The positive outcomes have spurred global initiatives to expedite the process of identifying cryptic species and standardize the screening of species diversity (Lakra et al. 2016). Furthermore, intraspecific genetic variation in fish species can be discovered using the DNA barcoding method (Decru et al.2016).

96 species under 52 genera and 19 families from Melghat Tiger Reserve, 17 species from the Salbardi region near Morshi taluka of Amravati district, and 36 species belonging to 11 families from the rivers of the Amravati district respectively (Yadav 2005; Wagh et.al 2008; Wankhade 2015) have been reported, but the identification of fishes was done by a classical method which sometimes could give discrepancies in species confirmation. To overcome this limitation, the use of molecular tools has proven beneficial, and the present study is one of the few and first in this region to analyse the fish diversity using DNA barcoding.

MATERIAL AND METHODS

Study Area – Major rivers and their tributaries in the Amravati district : Amravati district lies between – (20° 32' and 21° 46' NL) and (76° 37' and 78° 27' EL). It occupies an area of 12,149.7 sq. Km. This district is situated right in the center of the northern border of Maharashtra State. The district is an undulating plain of black soil of a fertile type, its richest tracts being perhaps in the neighborhood of the Wardha and the Purna rivers. It is watered by several streams which rise in the Satpudas in the north. The climate of this district is characterized by a hot summer and general dryness throughout the year except during the southwest monsoon season. The temperature of the district varies between 12.4°C to 44.5°C and the average rainfall is 841.8.

The district is bestowed with three major rivers namely the Tapi river, Purna river, and the Wardha river, and their important tributaries like the Sapan river, Chandrabhaga river, Pedhi river, Sipna river, Bembla river, Gadga river, Khandu river, Khapra river, Dolar river, were surveyed during the study. Tapi lies towards the southern part of the Melghat hills, The Purna, the largest of them rises near Bhainsdehi in the Betul district of Madhya Pradesh at a height of just over 760 meters in the Satpudas, The Wardha river rises to the east of Multai in Madhya Pradesh and forms the eastern boundary of the Amravati district and receives several short tributaries on its right flowing within the district.

In the Amravati district, the area of Melghat is drained by the Khandu river, the Khapra river, the Sipna river, the Gadga river and the Dolar river which are tributaries of the Tapi river. The climate of Melghat is tropical and the forest is dry and deciduous in which December is the coldest month 13°C and 22°C is the maximum temperature. Annual rainfall amounts to 2250 mm which gradually decreases towards the north where it is recorded to 1000mm only.

View of rivers in the Amravati district including Melghat surveyed during the study period to document fish diversity

Methodology

Sample collection: Fishes were collected from different rivers of the Amravati district including Melghat namely the major rivers like the Tapi, Purna, and Wardha and their major tributaries. All the fishes were identified morphometrically, with the help of Day (1875-78, 1889), Koumans (1953), Talwar and Jhingran (1991) FAO-Fisheries Identification Sheets (1974). Voucher specimens were maintained in the college departmental laboratory. Samples were collected from December 2022 to May- 2024. Digital photographs of all the fishes were taken immediately and the fish were

stored at (-20°C), and approximately 100 mg of muscle tissue from each species was preserved in 70% ethanol until used. Further procedures from the DNA isolation to the Fish identification were performed with the help of the experts in the Bioscience Barcoding Laboratory, Banglore, India.

Table 1. Riverwise stations were covered during the study.

Rivers	Surveyed Stations	GPS coordinates
Tapi	Rangubeli	77.14015°N and 21.71775°E
	Amner fort	76.78457°N and 21.52881°E
Sipna	Semadoh	77.31222°N and 21.497444°E
	Kolkas	77.17418°N and 21.50213°E
	Harisal	77.124218°N and 21.523066°E
Gadga	Amner fort	76.78457°N and 21.52881°E
Dolar	Dhakna	77.05934°N and 21.433778 °E
Wardha	Upparwardha	78.022228°N and 21.30918°E
Purna	Asegaon Purna	77.569182°N and 21.1267°E
Pedhi	Walgaon	77.70328°N and 20.99899°E
Sapan	Sawali	77.485433°N and 21.310439°E
Chandrabhaga	Wadgaon	77.438672°N and 21.279106°E
Bembla	Bhuikhed	78.014728° N and 20.654545°E

Experimental Methods

1. DNA was isolated from the tissue sample of fish provided. Its quality was evaluated on 1.0 % agarose gel, and a single band of high-molecular-weight DNA was observed.
2. Fragment of the COI (cytochrome oxidase-I) gene was amplified by Fish F1 and Fish F2; Fish R1 and Fish R2 primers. A single discrete PCR (Polymerase chain reaction) amplicon band of 700 bp was observed when resolved on agarose gel.

Fish F1- 5'TCAACCAACCACAAAGACATTGGCAC3'
Fish F2- 5'TCGACTAATCATAAAGATATCGGCAC3'
Fish R1- 5'TAGACTTCTGGGTGGCCAAAGAATCA3'
Fish R2- 5'ACTTCAGGGTGACCGAAGAATCAGAA3'

1. The PCR amplicon was purified to remove contaminants.
2. Forward and reverse DNA sequencing reaction of PCR amplicon was carried out with Fish F1 and Fish F2; Fish R1 and Fish R2 primers using BDT v3.1 Cycle sequencing kit on ABI 3730xl Genetic Analyzer.
3. A consensus sequence of COI genes was generated from forward and reverse sequence data using aligner software.
4. The COI gene sequence was used to carry out BLAST (Basic Local Alignment Search Tool) with the 'nr'(non-redundant) database of the NCBI (National Center for Biotechnology Information) GenBank database. Based on the maximum identity score first ten sequences were selected and aligned using the multiple alignment software program Clustal W.

Data analysis: In total 46 species sequences were aligned using Clustal W and pairwise evolutionary distance was determined by the Kimura 2-parameter method (Kimura 1980) using the software program MEGA 11. Reference sequences of these five species were retrieved from NCBI (National Center for Biotechnology Information) GenBank and the familywise phylogenetic tree was constructed using the maximum likelihood method. To verify the robustness of the internal nodes of the ML tree, bootstrap analysis was carried out using 100 pseudoreplicates. The base composition and genetic distance of each fish species barcoded was obtained using the software MEGA 11.

RESULTS AND DISCUSSION

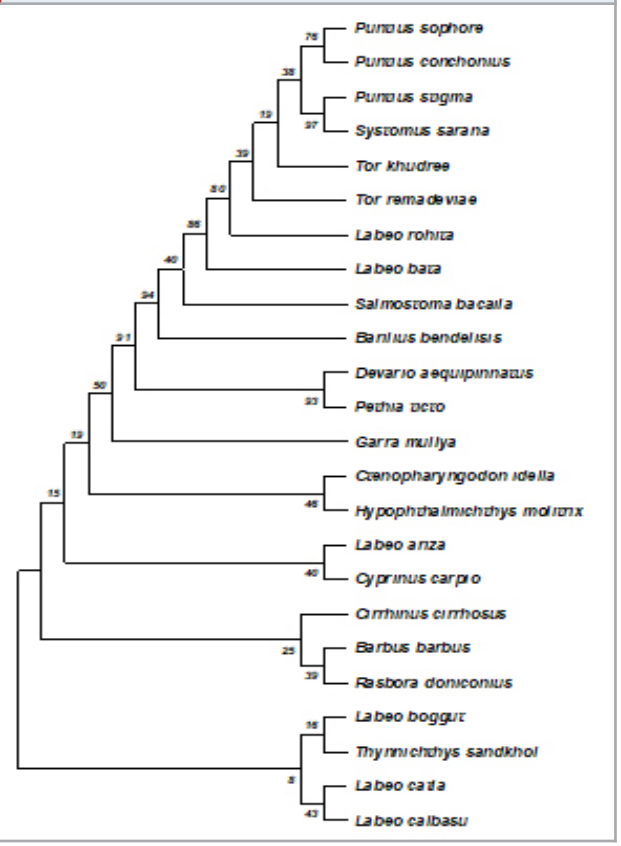
A total of 46 COI of different freshwater fish species were analyzed in the Amravati district including the Melghat landscape from 17 families and 35 genera. Among the 46 species identified 18 species are newly recorded for the Amravati district. The BLAST searches by each sample sequence in GenBank revealed the closest matches with sample 1 depicting the scientific name, IUCN category, and accession number (NCBI). COI barcodes obtained ranged from 604 to 664 bp, with an average of 640 bp (table 2).

Maximum diversity has been seen in the Wardha river with some 17 species of fishes, followed by the Tapi from the Melghat landscape which is 15,the Purna river, the Pedhi river, the Chandrabhaga river,the Sapan river, the Bembla river, the Sipna river from the Melghat.

Nucleotide content analysis showed the following average frequencies: Adenine (A): 22.43%, Thymine (T): 28.21%, Cytosine (C): 25.32%, and Guanine (G): 24.04%. Overall nucleotide content and content at each codon position are presented in Table 3. *Devario aequipinnatus* from family Cyprinidae showed the highest overall GC content at 40.00% (G: 15.71% + C: 24.29%) while *Oreochromis mossambius*

from family Chhichlidae had the lowest at 28.57% (G: 15.71%+ C: 12.86%).. Overall genetic distance within the family Channidae is 0.75%, Cyprinidae 0.82% and the other remaining fishes of different families is 0.97%.

Figure 3: The evolutionary history was inferred by using the Maximum Likelihood method and Kimura 2-parameter model. The percentage of trees in which the associated taxa clustered together is shown next to the branches. This analysis involved nucleotide sequences of the Cyprinidae family using MEGA11.



The genetic distance between the fishes of different families is highest displayed increasing genetic variation at increasing taxonomic levels. The phylogenetic tree shows that the species are all related, but some are more closely related than others. For example, in the cyprinidae family, the species *Puntius sophore* and *Puntius conchonius* are more closely related to each other than they are to any other species in the tree. This is because they share a more recent common ancestor and are similarly the same in the other two phylogenetic trees. *Clarias batrachus* clusters with *Heteropneustes fossilis* with high support (92%). This suggests that these species share a more recent common ancestor than with other species in the tree. They belong to the family Clariidae, which are air-sac catfish.

The clade with *Oreochromis mossambicus* (Oreochromidae) and *Pygocentrus nattereri* (Serrasalmidae) has moderate support (70%). This grouping is less certain than the Clarias-Heteropneustes grouping. It suggests these lineages may have diverged from a common ancestor more distantly than the Clarias and Heteropneustes species. *Anguilla bengalensis* (Anguillidae) and *Schistura savona* (Nemacheilidae) form a separate clade with high support (76%). This means they likely share a more recent common ancestor than with other species on the tree. Several well-supported clades are present at the bottom of the tree. These include the clade with *Pangasius pangasius* and Mystus bleekeri (both Pangasiidae) and the clade with *Xenentodon cancila* (Notopteridae) and *Notopterus notopterus* (Notopteridae).

This suggests strong evolutionary relationships within these families. DNA barcoding can be used for the authentication of documenting the fish diversity within the area of high potential for biodiversity existence due to the supporting ecology present there.

The primers used in the study were able to target and amplify the COI gene region in all 46 specimens of fish. No insertions and deletions were found in the sequence and upon translation, no stop codons were detected. This supports the hypothesis that mitochondrial COI sequence can be used as a standard region for identifying animal species (Hajibabaei et al. 2007b). Fishes like *Tor khudree* and *Tor remadevii* which are recorded from the Gadga river and Tapi river of the Melghat landscape respectively are highly significant fishes ecologically and demanded by locals due to their taste falling under the Critically Endangered and Vulnerable category of IUCN red-list had been identified at the molecular level for the first time in the Amravati district which will help the respective management authority to take actions for their conservations.

In terms of average genetic distances within various taxonomic levels, an increasing pattern was observed as the taxa became less exclusive. In which *Systomus sarana* was recorded for the first time in the Melghat landscape. 18 fishes shown with asterisk marks are newly reported for the Amravati district as compared to the previous record done by (Wankhade, 2015) which too based on molecular evidence (table 2). several species like *Barbus barbus, Barilius bendelisis, Cirrhinus cirrhosus, Devario aequipinnatus* make new records for the Amravati district. Some species like *Barilius bendelisis, Rasbora doniconius, Thynnichthys sandkhol, Devario aequipinnatus, Tor remadevii* (VU), *Anguilla bengalensis* (NT), *Tor khudree*(CR) come under the red-list of IUCN category.

All the fishes mentioned in (Table 2) are barcoded and this has been the first attempt for the fish fauna in the Amravati district including Melghat. Earlier the work done by (Yadav 2005; Wagh et.al., 2008; Wankhade, 2015) was only based on the classical level. Table 3 provides the nucleotide composition which infers that there is variation in the nucleotide composition and hence gives evidence that fishes are different from one another at the genetic level. The decline in the number of native fish species in the Amravati district including the Melghat landscape and the changing species composition over time due to the changes in the ecological factors in the rivers call for strict enforcement of regulatory measures that will protect the native fish species found in the rivers.

CONCLUSION

In this study, DNA barcoding using the mitochondrial COI gene was successful in discriminating 46 species of fish in the Amravati district including the Melghat region. Furthermore, DNA barcoding has advanced the study of the river's ichthyofauna by providing new taxonomic information at the molecular level as well as identifying previously unreported species. Effective management of the Amravati district native fish populations, which have been in decline both in abundance and diversity due to anthropogenic disturbances and increasing use of the rivers for fisheries. Finally, the COI sequences submitted to BOLD and GenBank can aid others in accurate species identification once these are made publicly available. Additional specimens of those species with very few vouchers should be collected further to assess better the uniqueness of the barcode sequence of each species.

ACKNOWLEDGMENTS

The authors sincerely appreciate the University Grant Commission (UGC)'s financing and essential support, which enabled them to conduct research. They are thankful to the Principal of Shri Shivaji Science College Dr. G.V.Korpe and Department of Zoology for the laboratory facilities provided. They are thankful to the Barcoding Biosciences laboratory, Bangalore for the laboratory facility provided for molecular analysis of samples. Also grateful to Kamlesh Wadhokar, Arati Kolhe, and Swara Wadhokar for their assistance during fieldwork.

Pharmacokinetic and ADMET Properties of Bio Actives from *Catharanthus roseus* and its Associated Molecular Docking Against Thioredoxin-Interacting Protein and Protein Tyrosine Phosphatase 1B for Management of Type 2 Diabetes

Moti Lal Gupta and Shashi Bhushan Lal*
Department of Zoology, B N College, Patna University , Patna 800004, Bihar India.

ABSTRACT

Catharanthus roseus Linn., often known as Shadabahar, is a medicinal herb whose leaf extract has traditionally been used to prevent type 2 diabetes. The study's objectives were to identify lead small molecules as diabetic medications phytocompounds using molecular docking, as well as to determine the bioactive pharmacokinetics of plants and ADMET (absorption–distribution–metabolism–excretion–toxicity) characteristics. In silico analysis of ADMET properties of four phytocompounds and a common synthetic medicine using PkCSM software, as well as receptor-ligand binding energy along with interaction studies through molecular docking for phytocompounds found in *Catharanthus roseus* Linn. on tyrosine phosphatase 1B or TP1B (PDB ID: 2BGD) followed by Thioredoxin interacting protein or TXNIP (PDB ID: 4LL1) as a causative agent for T2D was done. The molecular docking was carried out using AutoDock 4.2 to determine the optimal binding affinity & energy. The molecular interaction was visualised using the molecular graphics laboratory (MGL)/ Chimaera X tool. Petunidin, Hirsutidin, Catharanthine, and Vindoline from *Catharanthus roseus* & Rosiglitazone demonstrated satisfactory findings on the numerous parameters used to evaluate the ADMET qualities.The molecular docking revealed that Hirsutidin had a lower binding energy (-7.62 Kcal/mol) on the TP1B receptor than Catharanthine on the TXNIP receptor (-5.8 Kcal/mol) when compared with synthetic medicines Rosiglitazone which had binding energy (-7.12 Kcal/mol) & (- 4.75 Kcal/mol) on the TP1B and TXNIP receptors. Finally, the predictions indicated that Hirsutidin or Catharanthine might represent a promising lead option for T2D prevention. It is proposed that the current prediction be validated with experimental toxicology & pharmacological assays in the future.

KEY WORDS: CATHARANTHUS ROSEUS; ADMET PROPERTIES; MOLECULAR DOCKING; TYROSINE PHOSPHATASE 1B; THIOREDOXIN INTERACTING PROTEIN.

INTRODUCTION

The term "diabetes mellitus" refers to a collection of metabolic diseases characterised by elevated blood glucose levels brought on by deficiencies in either the secretion or the function of insulin (Ganie and Kotwal, 2012). Based on its pathophysiology, diabetes mellitus can be divided into three groups (IDF , 2013). An auto-immune response is the cause of type 1 diabetes (Liu ,et al.; 2017). Another subtype found in pregnant women is gestational diabetes mellitus. Insulin sensitivity and declining beta cell insulin production are the root causes of type 2 diabetes (Yoshihara , et al.; 2014). Numerous recorded pieces of evidence support the idea that pancreatic beta cell loss plays a part in the onset of diabetes, (Alhawiti ,et.al;2017 Sanyaolu et al 2023).

Thioredoxin-interacting protein, or TXNIP for short, is a protein that regulates metabolism and is present in key organs such as the liver, skeletal muscles, and adipose tissues. TXNIP are proteins that belong to the alpha arrestin family. TXNIP interacts with Thioredoxins (TXN1 and TXN2), causing them to become less active. Through controlling adipogenesis, peripheral glucose absorption, beta cell activity, and other processes, TXNIP is crucial for the regulation of glucose and lipid metabolism. Insulin sensitivity is decreased and pancreatic beta cell death is caused by overexpression of TXNIP (Alhawiti, et al; 2017).

The TXNIP protein binds to TXN1, interfering with TXN1's capacity to decrease oxidised protein, leading to oxidative stress and increased apoptotic possibilities. After migrating to the mitochondria, TXNIP competes with apoptosis signal regulating kinase 1 (ASK-1) to interact with TXN2, causing ASK-1 to be released. ASK-1 frequently binds to TXN2, inhibiting its activity (Yoshihara , et al.; 2014). Pancreatic beta cells' apoptotic signalling cascade is triggered when the released ASK-1 is phosphorylated and activated as a result of TXNIP activity. Diabetes is primarily caused by beta cell dysfunction and reduced insulin production (Wondafrash , et al; 2020 Sanyaolu et al 2023).

A non-transmembrane enzyme called protein-tyrosine phosphatase 1B (PTP1B) is present on the endoplasmic reticulum (ER). Its importance comes from the fact that it negatively regulates both insulin and leptin signalling. Insulin receptor substrate proteins, also known as PTP1B, are the main substrates of the insulin receptor (IR) and are dephosporylated, or to put it another way, free of a phosphate group. PTP1B in leptin removes phosphate from JAK2, a tyrosine kinase known as Janus kinase 2.

It has lately been discovered to be an important factor in the development of tumours and has been connected more directly to breast cancer. It is also considered a possible pharmacological target since its blockage may prevent type 2 diabetes, obesity, and some types of cancer. Because of its highly conserved positively charged active site pocket, protein tyrosine phosphatase 1B (PTP1B) is a useful target for the treatment of type 2 diabetes and obesity.

However, PTP1B is difficult to target for drug discovery. Significant progress has been achieved in the creation of highly potent and specific PTP1B inhibitors that bind to both the active and catalytic sites. To enhance the pharmacological characteristics of PTP1B inhibitors, a number of approaches are being investigated (Rohan et al 2011). In addition to being a therapeutic target for the treatment of insulin resistant conditions including obesity and type 2 diabetes mellitus, protein tyrosine phosphatase 1B (PTB1B) is becoming more and more important in the pathogenesis of the resistance to insulin in diabetes mellitus (Radhika et al,2012). Moreover, PTP1B contributes to the suppression of leptin and insulin signalling. Consequently,

PTP1B inhibitors offer therapeutic potential for the treatment of Type II diabetes as well as obesity. There is persuasive evidence that small molecule PTP1B inhibitors may be helpful in managing insulin resistance early on, resulting in a T2DM and obesity preventive strategy (Rao et al 2006).

According to Ayurvedic research, the flower of *Catharanthus roseus* is said to treat diabetes. Several laboratory investigations have shown that *Catharanthus roseus* extracts derived from various plant components, such as the root, leaf, flower, and stem, have hypoglycemic action. Throughout India, people have been using the ancient medicinal plant *Catharanthus roseus* to cure diabetes. Patients with diabetes mellitus are given various plant components, such as leaves, flowers, and stems (Jayanthi et al 2010). Flowers of *Catharanthus roseus* include numerous bioactives such as Petunidin, Hirsutidin, Catharanthine, and Vindoline. Bioactives are a category of natural compounds with varying polyphenolic structures that have anti-oxidant, anti-diabetic, and anti-aging properties (Saul et al 2009).

Other phenolic compounds, including petunidin, are naturally occurring polyphenols that preserve pancreatic beta cells, promote their growth, lower beta cell death, and reduce oxidative stress, all of which aid in the prevention and management of Type 2 Diabetes Mellitus (Sun, et al; 2020). Identifying targets and predicting innovative medications In-silico approaches have been quite important (Wadood et al., 2013). With the use of bioinformatics tools and AutoDock Tools to assess the docking score, the current work examined the bioactive from *Catharanthus roseus* inhibitory effect on TXNIP and PTP 1B protein.

MATERIAL AND METHODS

TXNIP and PTP 1B protein retrieval, Ligand preparation

and active site prediction: The crystal structure of the TXNIP and PTP 1B proteins was obtained from the Protein Data Bank of the Research Collaboratory for Structural Bioinformatics (www.rcsb.org/pdb). ADT was used to add hydrogen bonds & Kollman charges to the obtained protein structure. The structures of Petunidin, Hirsutidin, Catharanthine, and Vindoline, as well as the control medication Rosiglitazone, were obtained from PubChem (https://pubchem.ncbi.nlm.nih.gov) in canonical SMILES. ChemSketch was used to build and optimise 3D structures. The compound structures were stored as MDL mol files (.mol). The MDL mol files were then translated to PDB format via the Open Babel molecular converter (Boyle et al 2011).

Figure 11: The docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Vindoline calculated by molecular docking study.

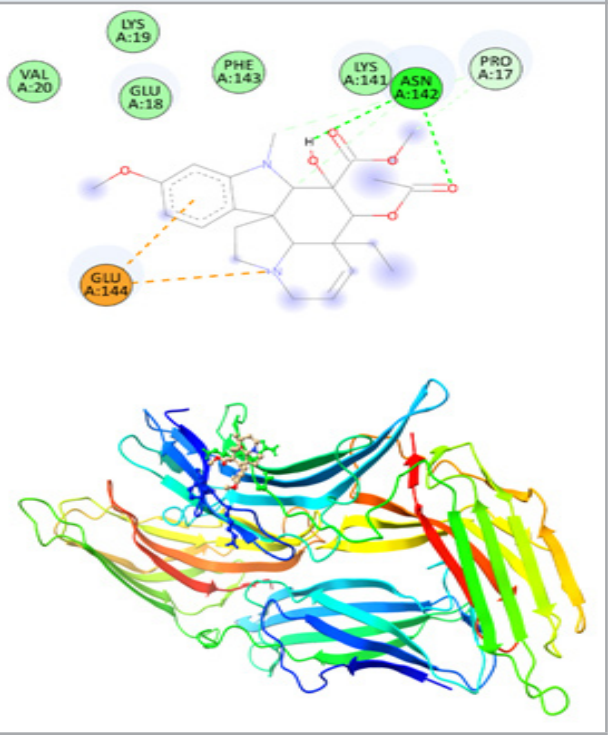

Figure 12: The docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Rosiglitazone calculated by molecular docking study.

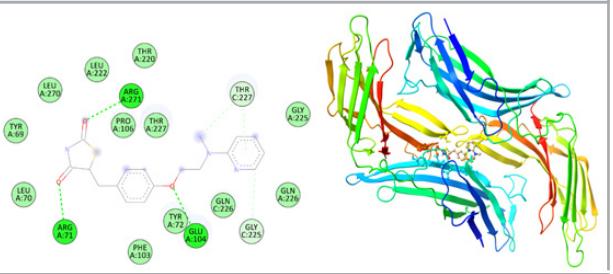

Evaluation of Molecular Properties and Ligands ADMET prediction studies for the chemicals: The compounds' physiochemical and pharmacological characteristics were examined using the the "SwissADME" an implement offered by Swiss Institute of Bioinformatics (www.swiss adme.ch) for Properties such as molecule size, rotatable bond, logP, and hydrogen bond donor and acceptor properties were calculated. The selected ligands were examined for membrane permeability, bioavailability, distribution, metabolism, and adsorption (Lipinski's rule of 5) (Lipinski et al 2001, Jarrahpour, et al 2012). Compound pharmacokinetic properties was predicted using the web server PkCSM (unimelb.edu.au)(Pires et al 2015). It expects several parameters based on specific qualities. These factors include absorption, distribution, metabolism, and excretion, which help us determine a drug's pharmacokinetics. Drug absorption can be anticipated using variables such as CaCO2 and skin permeability, intestinal absorption, and P-glycoprotein substrate or inhibitor. The drug's distribution was predicted using factors that include volume distribution (VD), permeability of the central nervous system (CNS), and the blood brain barrier (BBB). Metabolism was determined using the Cytochrome P450 model. The drug's excretion was measured by its total clearance, renal substrate.

Molecular docking: To determine the affinity, the AutoDock Tool was used to dock Petunidin, Hirsutidin, Catharanthine, and Vindoline from C. roseus, as well as the control Rosiglitazone, against TXNIP and PTP 1B proteins (GM Morris et al, 1998). Kohlman charges and polar hydrogen atoms were introduced to the 3D TXNIP and PTP 1B macromolecular structure. The protein-ligand interaction of , Hirsutidin, Petunidin, Catharanthine, Vindoline and the control Rosiglitazone against TXNI and PTP 1B P protein was visualised with Molecular graphics laboratory (MGL)/Chimera X tool.

The structures of ligand under investigation were processed in Chimera to obtain a minimum energy conformer through 10 steepest descent steps followed by 100 conjugate gradient steps. The stabilized ligand conformers were also saved in .pdb format. The protein-ligand docking complexes were performed using AutoDock 4.2 (Forli et al.2016,Morris et al 2009). The LGA method was employed. A grid point spacing of 1.000 Å was set, centered on x= 86, y= 86, and z= 86Å for the TXNIP protein docking. And a grid point spacing of 0.500 Å was set, centered on x= 60, y= 60, and z= 60Å for the PTP1B protein docking. The coordinates of central grid point of maps (-14.025, 1.890, 40.242 Å) for TXNIP protein docking and (-1.591, 62.698, 2.975 Å) was used for PTP1B (2BGD) protein docking.

RESULTS AND DISCUSSION

Molecular properties of the bio actives of Catharanthus roseus & Rosiglitazone: Molecular compound selected for the Phyto chemical from the *Catharanthus roseus* have less than 500 daltons of molecular weight which is in accordance with the Lipinski rule of five and is also comparable with the control drug Rosiglitazone. Octanol- water partition coefficient (log P) was found to be less than 5 for all Phyto compounds used in this study. Number of hydrogen bond acceptors for Petunidin, Hirsutidin, and Rosiglitazone was

calculated to be as 6 and 3 hydrogen bond acceptors for Catharanthine and 8 hydrogen bond acceptors Vindoline. Catharanthine, Vindoline and Rosiglitazone have only one hydrogen bond donor whereas Petunidin and Hirsutidin have 5 and 3 donors bond respectively. Surface Area was least for Petunidin and highest for Vindoline satisfying the Lipinski rule of five for prediction as an ideal drug candidate for treatment of T2D.

ADMET properties of the bio actives of Catharanthus roseus & Rosiglitazone: ADMET properties of the bioactives such as Petunidin, Hirsutidin, Catharanthine, and Vindoline from *Catharanthus roseus* & Rosiglitazone , showed satisfactory results on the various parameters used to evaluate the ADMET properties. Absorption parameter Catharanthine violated the Caco2 permeability as it have 1.114 log cm/s permeabilities which should be not more than 0.90 log cm/s. Intestinal absorption (human) is grater than 30% for all the bioactive such as Petunidin, Hirsutidin, Catharanthine, and Vindoline from *Catharanthus roseus* & Rosiglitazone which showed good results on this parameter. Skin Permeability of Vindoline among all the Phyto chemicals and Rosiglitazone was highest with log Kp cm/h of -3.088 but all the bioactive such as Petunidin, Hirsutidin, Catharanthine, and Vindoline from *Catharanthus roseus* & Rosiglitazone showed violation and are greater than -2.5 log Kp cm/h.

P-glycoprotein substrate was formed by all the bio compounds whereas Rosiglitazone have not formed P-glycoprotein substrate and P-glycoprotein II inhibitor. Only Vindoline had all the P-glycoprotein substrate , P-glycoprotein I inhibitor and P-glycoprotein II inhibitor during PkCSM assessment. VDss (human) was low for Hirsutidin and Rosiglitazone with -0.215 L/kg and – 183 L/kg. Fraction unbound (human) for all the phyto chemical and synthetic drug was considered safe while BBB permeability and CNS permeability was only satisfactory for Catharanthine during the analysis. CYP3A4 substrate was not formed by Petunidin whereas CYP2C9 inhibitior was not produced by Catharanthine and CYP2C9 inhibitior by Hirsutidin. CYP3A4 inhibitior none of the natural or synthetic compound forms CYP3A4 inhibitior at the metabolism parameters of pharmacokinetic. On excretion parameters Total Clearance and Renal OCT2 substrate Catharanthine performs poorly. AMES toxicity was also positive for only Catharanthine while Hepatotoxicity was positive for Rosiglitazone only.

Molecular docking analysis: Binding energy (kcal/mol) and inhibition constant (μM) values of the docking complexes of proteins Tyrosine phosphatase PTP1B(2BGD) with Hirsutidin calculated by molecular docking study was -7.62 kcal/mol and 2.61 μM suggestive of its preference over the synthetic drug Rosiglitazone whose Binding energy was -7.12 kcal/mol with inhibition constant at 6.02 μM . All the bio actives selected from *Catharanthus roseus* performs good in comparison to the Rosiglitazone at parameters like Binding energy (kcal/mol) and inhibition constant (μM) values during Molecular docking analysis of the docking complexes of proteins Tyrosine phosphatase PTP1B(2BGD) as shown in table no 4.

All the bio actives selected from *Catharanthus roseus* performs good in comparison to the Rosiglitazone at the parameters like Binding energy (kcal/mol) and inhibition constant (μM) values during Molecular docking analysis of the docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) as shown in table no 4. Binding energy (kcal/mol) and inhibition constant (μM) values of the docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Catharanthine calculated by molecular docking study was -5.8 kcal/mol and 56.12 μM suggestive of its preference over the synthetic drug Rosiglitazone whose Binding energy was -7.12 kcal/mol with inhibition constant at 6.02 μM.

The docking complexes of proteins Tyrosine phosphatase PTP1B(2BGD) with Catharanthine has three van der waals bond at PHE 182, ILE 219 and GLN 262 , two Alkyl bonds at ALA 217 and VAL 49 with a single Pi-Pi Bond at TYR 46, Hydrogen bond at AGR 47 and a salt bridge at ASP 48. The docking complexes of proteins Tyrosine phosphatase PTP1B(2BGD) with Hirsutidin had five conventional hydrogen bond at ASP 48, GLN 262, SER 216 , ARG 221 and GLU 115 followed by Van der waals active forces at ARG 47, GLY 218, ILE 219 and GLY 220. The complex also do have carbon hydrogen bond at ASP 181 and LYS 120, Pi- Pi bond at PHE 182 and TYR 46 , Alkyl bond at ALA 217 & CYS 215 followed by Pi sigma bond at VAL 49.Tyrosine phosphatase PTP1B(2BGD) on docking with Petunidin produces 6 conventional hydrogen bond at ASP 48, SER 216, AGR 221, GLU 115, GLN 262 and ALA 217 followed by Pi sigma bond at VAL 49. The docking complex also have Pi-Pi bonds at TYR 46 and PHE 182.

The complex between Tyrosine phosphatase PTP1B(2BGD) and Petunidin also have five Van Der Waals forces site at GLY 220, GLY 128, ASP181, ARG 47 and LYS 120 with an alkyl bond at CYS 215.Tyrosine phosphatase PTP1B(2BGD) on interaction with Vindoline produces Pi- alkyl bonds at MET 258, ALA 217, VAL 49 AND ILE 219 and a salt bridge at ASP 48. Only one conventional hydrogen bond at ARG 24 with four Van der waals site at ARG 46, PHE 182, ARG 254 and TYR 46. The complex also do have two Carbon Hydrogen bonds at TYR 20 and GLN 262.

The docking complexes of proteins Tyrosine phosphatase PTP1B(2BGD) with Rosiglitazone had a Pi sulphur bond at PHE 182 and Pi-Pi bonds at PHE 182 and TYR 46 . The Interaction studies also reveals that there is also an unfavourable donor at AGR 221 with nine Van Der Waals site of interactions at SER 222, ASP 181, AGR 47, ASP 48, VAL 49, LYS 120, SER 216 and GLN 262. The docking complexes of proteins Tyrosine phosphatase PTP1B(2BGD) with Rosiglitazone had seven conventional hydrogen bonds positioned at GLY 218, GLY 220, ALA 217, ILE 219, CYS 215, GLN 266 and PHE 182.

Van Der Waals interactions were active at TYR 72, GLN 226, GLY 225, THR 227, PRO 106, GLN 107, GLN 226, THR 227, LEU 222, PHE 103, LEU 270, THR 69 and ARG 71 in the docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Catharanthine. The

docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Catharanthine had conventional hydrogen bond at GLU 104 and GLY 225 with Alkyl bond at PRO 106 and Leu 70. Hirsutidin on interaction with TXNIP produces conventional hydrogen bond at GLY 266 , THR 66 and Lys 64 and carbon hydrogen bond at SER 298 and ILE 296. PRO 262, ILE 260, ILE 269, THR 274 was the site for Pi- alkyl bond in the docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Hirsutidin.

Van Der Waals interactions in the docking complexes of protein TXNIP (4LL1) with Hirsutidin were at GLN 65, GLY 297, VAL 272 , ASN 268, SER 267 and AGR 71.Thioredoxin interacting protein ,TXNIP (4LL1) on interactions with Petunidin had Pi Anion bond at ASP 74 with Pi alkyl bond at LEU 77. Conventional hydrogen bonds were represented by THR 227, ASP 74, GLY 102, LYS 100 and LEU 77.Van Der Waals interactions were active at GLN 226, LYS 228, THR 72, PHE 101, LEU 76, THR 231 and VAL 229 in the docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Petunidin.

The docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Vindoline calculated by molecular docking study showed Pi Anion or active charge at GLU 144 with conventional hydrogen bond at ASN 142. There was also Van Der Waals interactions at VAL 20, GLU 18, LYS 19 , PHE 143 and a carbon hydrogen bond at PRO 17. Thioredoxin interacting protein TXNIP (4LL1) on interaction with Rosiglitazone had three conventional hydrogen bonds at ARG 71, GLU 104 and AGR 271 with two Carbon hydrogen bond at THR 227 AND GLY 225. Van Der Waals forces were active at LEU 70, PHE 103, TYR 72, GLN 226, GLY 225, THR 220, LEU 222, LEU 270 and TYR 69.

The docking complexes of proteins Thioredoxin interacting protein TXNIP (4LL1) with Vindoline calculated by molecular docking study showed Pi Anion or active charge at GLU 144 with conventional hydrogen bond at ASN 142. There was also Van Der Waals interactions at VAL 20, GLU 18, LYS 19 , PHE 143 and a carbon hydrogen bond at PRO 17. Thioredoxin interacting protein TXNIP (4LL1) on interaction with Rosiglitazone had three conventional hydrogen bonds at ARG 71, GLU 104 and AGR 271 with two Carbon hydrogen bond at THR 227 AND GLY 225. Van Der Waals forces were active at LEU 70, PHE 103, TYR 72, GLN 226, GLY 225, THR 220, LEU 222, LEU 270 and TYR 69

CONCLUSION

The molecular docking revealed that Hirsutidin had a lower binding energy (-7.62 Kcal/mol) on the TP1B receptor than Catharanthine on the TXNIP receptor (-5.8 Kcal/mol) when compared with synthetic medicines Rosiglitazone which had binding energy (-7.12 Kcal/mol) & (- 4.75 Kcal/mol) on the TP1B and TXNIP receptors. When evaluated using different parameters, the ADMET qualities of bioactive from Catharanthus roseus, such as Vindoline, Hirsutidin, Petunidin, and Catharanthine, as well as Rosiglitazone, demonstrated satisfactory findings. ADMET properties like a AMES toxicity was positive for only Catharanthine whereas on Hepatotoxicity parameters Rosiglitazone was found to be positive .Finally, the predictions indicated that Hirsutidin or Catharanthine might represent a promising lead option for T2D prevention. It is proposed that the current prediction be validated with experimental toxicology & pharmacological assays in the future.

Diversity of Riverine Birds in Melghat Landscape, Maharashtra India

Chaudhari Pratik,* Gajanan Wagh and Vaishnavi Kuralkar
Biodiversity Research Lab, Shri Shivaji Science College, Amravati, Maharashtra, India.

ABSTRACT
Birds are useful bioindicators and provide conducive dispersal pathways and sufficient cover for migrating birds. As there is a lack of data regarding riverine avian diversity, the present study was carried out from November 2022 to December 2023. The study was done along the rivers flowing through the Melghat landscape in the district of Amravati India. The presence of birds in the area was recorded by a line transect and point count method using binoculars and DSLR cameras. A total of 245 birds belonging to 54 families were recorded. Out of which, 72 species from 20 families of water birds were recorded in the riverine zone and 173 species from 34 families of forest birds were recorded in the riverine zone. The majority of the observed species belonged to the Anatidae family followed by Ardeidae and Scolopacidae. Similarly, the Corvidae, Muscicapidae, and Sylviidae families show the maximum number of forest birds. According to the IUCN status, 87% of species associated with water are classified as least concern (LC), 10% as near-threatening (NT), only 3% are vulnerable. Similarly, for forest recorded birds, it is categorized as 98% species of least concern (LC), and only 2% are categorized as near-threatened (NT). Maximum species diversity was recorded with the forest bird associated in the riverine zone (D = 0.991 and H = 4.903), and minimum was recorded with the water bird associated in the riverine zone (D = 0.973 and H = 3.961). The study showed riverine avian diversity and threats in rivers.

KEY WORDS: DIVERSITY, MAHARASHTRA, MELGHAT, NEAR THREATENED, RIVERINE BIRDS.

INTRODUCTION

Riverine ecosystems are crucial habitats for a wide range of species, includes birds. It supports a disproportionately large fraction of its biodiversity while also acted as significant corridors for the movement of plants, animals, and nutrients (Naiman et. al., 1993; Strayer and Dudgeon, 2010). Riparian zones also provide conducive dispersal pathways and sufficient cover for migrating birds, thereby often supported a higher diversity of bird species (Sinha et. al., 2019). The phenomenon of rivers drying up is a global environmental challenge that has far-reaching implications for ecosystems, communities, and water security. Across the world, numerous rivers are experiencing reduced flow and, in some cases, complete drying.

This alarming trend is attributed to a combination of natural and anthropogenic factors, posing serious threats to biodiversity, livelihoods, and the availability of freshwater resources. Various studies have been conducted on the impact of such human actions on the river flow regime (Adib et al., 2016;; Kousali et al., 2022, Adib 2022). Choi et al (2005) examined the effects of the Hapchon dam on regime change in the Hwang River flow in South Korea. They found that the dam construction caused significant downstream changes in the river path. Humans exploiting rivers will reduce discharges and cross-sectional flow, depth, and even flow velocities, dramatically impacting river-dependent habitats (Jiao et al. 2019). That's why understanding the present status of riverine birds is crucial for assessing the impact of changing river conditions on avian biodiversity. Riverine birds are highly dependent on healthy river ecosystems for their survival, as rivers provide critical habitats for nesting, feeding, and breeding.

India hosts 1353 species of birds out of the 10721 total birds in the world, constitutes 13% of the total bird population, and thus is an area of high avian diversity. The bird fauna of India represents 114 families out of the total 249 families in the world. The inventory of birds in the state of Maharashtra comprises 556 species (Mahabal et al., 2005). More than 577 species have been reported from Maharashtra State (Kasambe 2016). Similarly, in Vidarbha, there are a total of 417 species, and in Amravati, there are 392 bird species (Wadatkar et al., 2016, Praveen & Jayapal 2023).

Documentation of avian diversity in Melghat has been done for the last 100 years. A preliminary checklist of 33 species of birds was prepared by R.T. Jenkin (then DFO, Melghat) and published in 1925 (Nelson 1925). Later, V. B. Sawarkar, then Director of Melghat Tiger Reserve, prepared and published the first comprehensive checklist of the birds of Melghat, which included 252 species. Malabar Pied Hornbill was not listed in the checklist of birds of MTR until 2003. (Wagh et al., 2003). Thereafter, some important sightings occurred, like the Critically Endangered Forest Owlet (Rithe 2003) and the Malabar Pied Hornbill (Kasambe & Wadatkar 2006). Previously, a total of 263 bird species were recorded in the overall Melghat Tiger Reserve (Mahabal, Anil 2005).

Then, in addition to the checklist of birds in Melghat, which went up to 265 species (Wadatkar et al., 2012), Later on, blue-tailed bee eaters breeding by the Tapti River at the boundary of Melghat were observed by Wadatkar et al. (2014). (Wagh et al., 2015) proposed that the preferential route of dispersal for Malabar Pied Hornbill from the Himalayas to the Western Ghats is through the Satpuda Hills in Central India. Nesting of River Lapwings was first recorded in the Tapi River near the Melghat Tiger Reserve (Wagh et al., 2020). The River Lapwing's population in the Vidarbha area is constrained to just a few large rivers; however, the species is presently at risk of extinction.

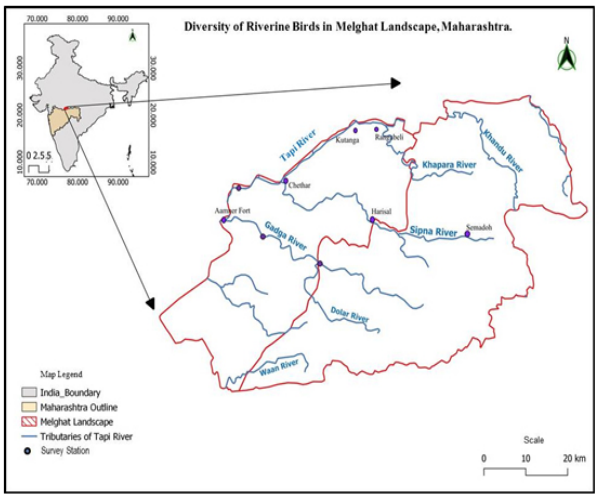
The first ever bird survey of Melghat Tiger Reserve reported a total of 340 bird species (January 2023). During our regular bird watching and surveys being conducted for the River Lapwing and Malabar Pied Hornbill projects, we sighted some species of birds that were not listed in the published checklists of MTR and Amravati district 2016. The results of this study shed light on the importance of conservation and protection of riverine ecosystems for the conservation of avian biodiversity.

MATERIAL AND METHODS

Study Area: The Melghat region is a part of the Satpuda Range of Hills in the Amravati district of central India. This area has dry deciduous forests dominated by teak and bamboo, with excellent tiger habitat. The study area is within latitudes 21°0′15″ to 21°0′45″ N and longitudes 76°00′57″ to 77°00′30″ E at elevations of 312 to 1178 m MSL. It is the largest of the three project tiger programmes in the state. The yearly average temperature is 42.7°C, and the annual rainfall is 1000 mm. The reserve is a catchment area for five major rivers: the Sipna, Gadga, Khandu, Khapra, and Dolar, all of which are tributaries of the Tapti River, which flows through the northern part of Melghat Tiger Reserve and forms the boundary of the Melghat landscape together with the Gawilghur ridge of the Satpura Range. (Fig.1,Table 1)

Survey Methods: Selected locations in the research area will be surveyed over the duration of a study period. Several surveys will be carried out in the summer (March–June) and after the rainy season (July–October) in 2023. A number of trips will be made to the Sipna River at Semadoh, Kolkas, and Harisal. Similarly, surveys of the Tapti river at the specified locations (Chethar, Kutanga, Rangubeli) and Gadga river locations (Dhakna, Kalamkhar, Aamner Fort) and other nearby potential rivers are needed to better understand the status and distribution of river birds.

Figure 1: Map Showing the Rivers of Melghat Landscape with Surveyed Stations, Maharashtra.



A survey has not been conducted on the Khandu River yet. Line transects and point count methods will be used in the riverine ecosystem to determine the diversity and distribution of riverine birds within the river basin. This methodology also helps to determine their abundance in a given research region. Visual scanning is a method of spotting birds primarily based on their visual characteristics and aids in locating their nest during the breeding season. This approach is based on the researcher being able to identify birds visually while recording birds along a predetermined route. For the purpose of searching for riverine birds, visual scanning is the process of scouting riverbanks, mudflats, and sandy areas. Binoculars and spot scopes were used to record observations, and Nikon DSLR cameras equipped with zoom lenses as well as video cameras were used to capture images and videos.

The Garmin GPS was also used to record the latitude and longitude of the broadcast spots. Field survey protocol: The study was carried out during the most active periods, i.e., early morning to mid-morning (6 a.m. to 10 a.m.) and late afternoon to evening (3 p.m. to 6 p.m.). The survey was conducted in the study area with the help of field assistants and local forest staff. To gather more information about the riverine birds in the study area, interviews were performed with locals, tribes, local forest employees, birdwatchers, fishermen, and nature guides. Data sheets and avian science forums were also used, along with field guides for the identification of river birds recorded in water and forest.

Statistical Analysis: Biological diversity indices were calculated to compare riverine sites. Various types of total species diversity indices, including Simpson's diversity index (-D) was used to estimate the biodiversity using the equation: $D = \sum ni\ (ni-1)/\ N\ (N-1)$, Where D = Simpson's

Index of Dominance ni = total number of individuals of a particular species N = the total number of individuals of all species (Simpson, 1949). Similarly, Shannon diversity index was determined by H′= - ∑ (Pi) (ln Pi), in which Pi = Proportion of total species belonging to ith species.The diversity indices were calculated using the software PAST version 4.03. (Table 4)

Table 1: The coordinates of birding station in the rivers of Melghat Landscape.

Rivers	Survey Stations	GPS Coordinates
Tapi River	Chethar	21.6023°N & 76.9085°E
	Kutanga	21.71468°N & 77.0840°E
	Rangubeli	21.71775°N & 77.1401°E
Sipna River	Semadoh	21.4944°N & 77.3122°E
	Kolkas	21.5021°N & 77.1748°E
	Harisal	21.5236°N & 77.1248°E
Gadga River	Dhakna	21.4338°N & 77.0509°E
	Kalamkhar	21.52823°N & 76.813°E
	Aamner fort	21.52814°N & 76.784°E

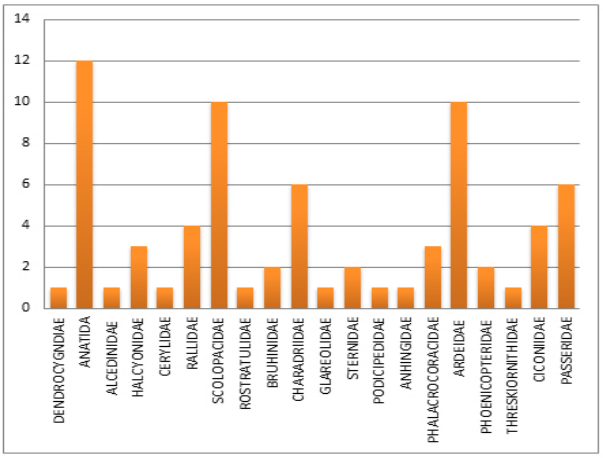

Figure 3: Family-wise forest birds recorded in riverine zone of Melghat Landscape.

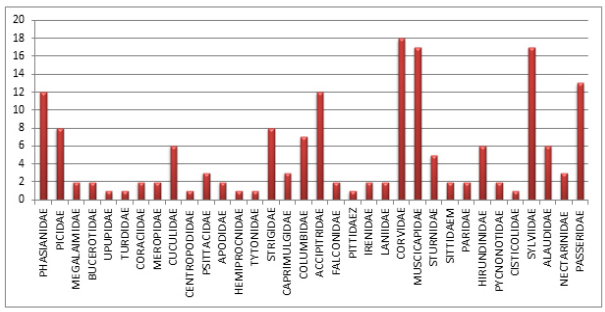

RESULTS AND DISCUSSION

In the course of an extensive survey conducted to determine the diversity of riverine birds in the riverine ecosystems of the Melghat Landscape, several key observations were made. The results of the study are as follows: total 245 species of riverine birds belonging to 54 families were recorded. In the riverine ecosystem of the Melghat landscape, a total of 861 individuals from water-recorded bird species were reported, and from forest-recorded birds, 2229 individuals were reported. The study area is richly diversified, with flowing, clean rivers all over the Melghat landscape (Table 4).

Out of which, 72 species from 20 families of water birds were recorded in the riverine ecosystem, and 173 species from 34 families of forest birds were recorded in the riverine ecosystem. Out of the 54 families of birds observed in the course of the study, the majority belonged to the Ardeidae family, followed by the Sylviidae, Phasianidae, Anatidae, Accipitridae, Corvidae, and Charadriidae families, which belong to forest birds (Fig 2 and 3).

A maximum of 12 species were recorded from the Anatidae family of birds in riverine ecosystems, including the Common Teal, Red-crested Pochard, Common Pochard, Indian Spot-billed Duck, Gadwall, Northern Shoveller, Eurasian Wigeon, Ruddy (Brahminy) Duck, Comb Duck (Knob-billed), and Cotton Pigmy Goose. While 10 species from the Scolopacidae family include Black-tailed Godwit, Pintail Snipe, Common Snipe, Common Greenshank, Spotted Redshank, Green Sandpiper, Common Sandpiper, Wood Sandpiper, Little Stint, Temminck's Stint, Also, a maximum abundance of 10 species were recorded from the Ardeidae family, including the Little Egret, Great Egret, Intermediate Egret, Cattle Egret, Grey Heron, Purple Heron, Striated Heron, Indian Pond Heron, Yellow Bittern, and Black Bittern, while the Charadriidae family includes the Red-Wattled Lapwing, River Lapwing, Black-Winged Stilt, Little-Ringed Plover, and Kentish Plover, as well as only one member from the Rostratulidae family, which is the Greater-painted Snipe.

We also noted the conservation status of recorded birds according to the latest updates on the IUCN's list of threatened species (2023), categorised as least concerned (LC), near threatened (NT), and vulnerable (VU), and the red lists of Bird Life International (Tables 2, 3, and Fig. 5 and 6). The IUCN Red List (2023) classified 87% of species as of least concern (LC) and 10% as near-threatening (NT): River Lapwing, Black-tailed Godwit, Great Stone Curlew, River Tern, Darter, Black-headed Ibis, and Painted Stork, where the 2 species that come in the vulnerable category are Asian Woolly-necked Stork and Common Pochard from water recorded birds in the riverine ecosystem of the Melghat landscape. Similarly, for forest recorded birds, it is categorised as 98% species of least concern (LC), and only Malabar Pied Hornbill, European Roller, Alexandrine Parakeet, and Pallas's Fish Eagle are categorised as near-threatened (NT). The study area habitat serves as a suitable habitat for more diversity and species richness in avian fauna.

Observations over different seasons highlighted variations in the composition and abundance of riverine bird species. Certain species were found to be migratory, emphasising the seasonal dynamics and the significance of the Melghat Landscape as a stopover or breeding ground for these birds. Birds migrate by rivers for several compellation reasons. Firstly, rivers serve as natural navigational guides, offering a clear and linear path. Their flow and direction act as visual cues and help birds stay on course during long migrations. This makes the journey more efficient and minimizes the risk of getting lost.

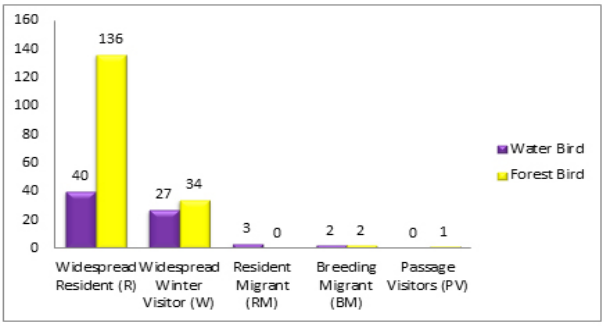

Figure 5: IUCN status of Water birds recorded in rivers in Melghat Landscape.

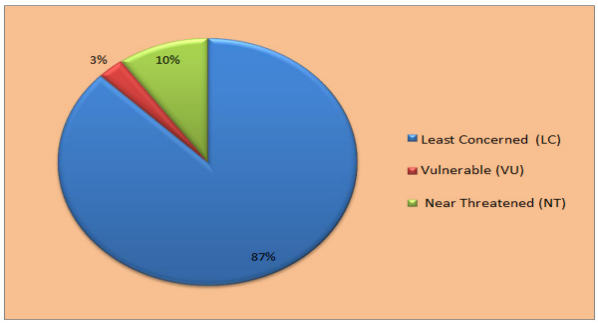

Secondly, rivers are abundant sources of food, provided migratory birds with a consistent and easily accessible food supply. Fish, insects, and other aquatic organisms thrive in and around rivers, allowed birds to replenish their energy reserves during stopovers. Additionally, the riparian habitats along riverbanks offer suitable resting and roosting sites

for birds. Resting is crucial during migration to conserve energy, and these areas provide shelter and safety, ensured the birds are well-prepared for the next leg of their journey. Lastly, rivers also provide a readily available source of water, essential for birds to drink and bathe in. Migratory birds often pause at rivers to quench their thirst and maintain their plumage, further contributing to their overall well-being during migration.

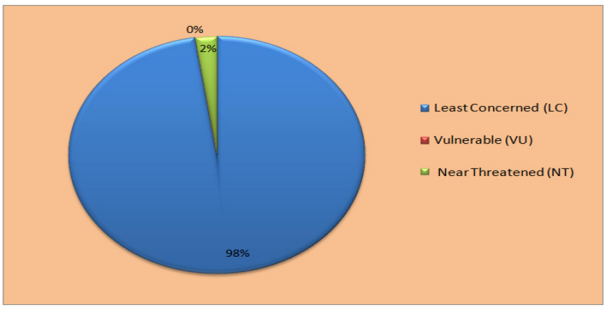
R- Widespread Resident, W- Widespread Winter Visitor, PV- Passage visitors, RM- Resident Migrant, BM- Breeding Migrant, V- Vagrant or irregular visitors, from Melghat Landscape.
IUCN's list of Threatened species (2023), categorized as Least Concerned (LC),
Near Threatened (NT) and Vulnerable (VU).

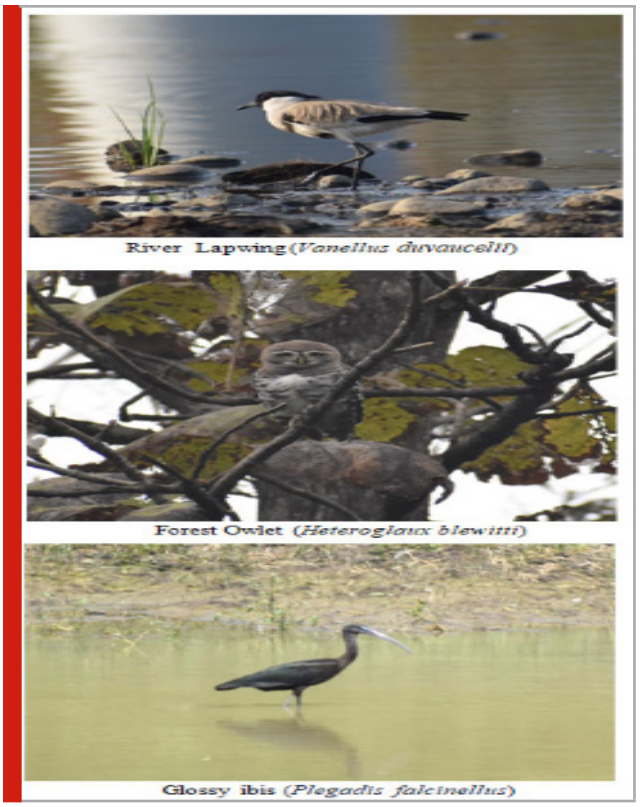
Table 4: Summary of Diversity indices of water birds and forest birds recorded in rivers of Melghat Landscape.

Observations	Water birds recorded in river	Forest birds recorded in river
Species numbers	72	173
Total Individuals	861	2229
Simpson Diversity Index [D]	0.973	0.991
Shannon Diversity Index [H]	3.961	4.903
Menhinick Index	2.42	3.604
Margalef Index	10.36	21.93
Evenness	0.7396	0.7921
Berger-Parker	0.06504	0.03146
Dominance	0.0247	0.0009
Fisher alpha	18.35	42.83

In the riverine survey of Melghat rivers, all the recorded species were categorised according to their presence in the study area. Where Widespread Resident (R) constitutes 40 species that account for 56%, Widespread Winter Visitor (W) includes 27 species that account for 37%, Breeding Migrant (BM) includes Kentish Plover, Little Tern, and Resident Migrant (RM), 3 species that are Painted Stork, Black-Winged Stilt, and River Tern from the water recorded birds of the riverine ecosystem of Melghat landscape (Fig.4).

Figure 6: IUCN status of forest birds recorded in rivers in Melghat Landscape.





Similarly, Widespread Resident (R) comprises 136 species that account for 79%, Widespread Winter Visitor (W) includes 34 species that account for 20%, Breeding Migrant (BM) includes Pied Cuckoo, Common Hawk Cuckoo, and Passage Visitors (PV) have Lesser Kestrel from the forest recorded birds of the riverine ecosystem of Melghat landscape (Fig.4).

Indicator bird species were chosen according to their ecological affinity for one of the four major wetland habitat types (marshes, wet meadows, shrub swamps, and treed swamps), their sensitivity to hydrological conditions (depth of surface water and fluctuations of water level) (Weller,

1999), and their nesting strategy (i.e., on ground near shoreline, on floating vegetation, or attached to vegetation above water or on ground) (Gibbs et al., 1991; Steen and Gibbs, 2002). The analyses presented here are restricted to a limited selection of indicator species distributed according to the four major wetland habitat types, riverine habitat types, the vulnerability of their nests, and the nature of the statistical relationship with hydrological variables, (Sinha et. al 2019).

Riverine birds are birds that are found in and around rivers, streams, and other bodies of freshwater. Some indicator species of riverine birds that are located as indicator species include the Green Sandpiper, River Tern, River Lapwing, Malabar Whistling Thrush, Pied Kingfisher, Stork Billed Kingfisher, Little Egret, Indian Cormorant, etc. These species were chosen based on their association with riverine habitats, sensitivity to changes in hydrological conditions, and nesting strategies.

The survey revealed a rich diversity of riverine birds in the Melghat Landscape, included various species such as egrets, kingfishers, herons, ducks, and waders. The presence of multiple species indicated a healthy and diverse avian community dependent on riverine ecosystems. The diversity index, species evenness, and species abundance were studied. In the water bird recorded with riverine ecosystem study area, various diversity indices, as mentioned, showed the result like Simpson Diversity Index is 0.973, Shannon Diversity Index is 3.961, Menhinick Index is 2.42, Margalef Index is 10.36, Berger-Parker is 0.06504, and evenness is 0.7396. Similarly, in forest birds recorded in riverine ecosystem areas, the Simpson Diversity Index is 0.991, the Shannon Diversity Index is 4.903, the Menhinick Index is 3.604, the Margalef Index is 21.93, the Berger-Parker is 0.03146, and evenness is 0.7921. Whereas abundance on the river of Melghat landscape reservoir is 3086 (Table 4).

The consistent presence of both the Pied kingfisher and the White-throated kingfisher across all riverine habitats in the Melghat landscape highlights the ecological adaptability and widespread distribution of these avian species in the region. The presence of the Black-capped kingfisher exclusively observed along the Dolar River underscores its ecological significance and uniqueness. The population of the Black-capped Kingfisher in this specific location is experiencing a decline. The potential sites for the River Lapwing as a hotspot are Chethar, Kutanga, and Rangubeli, and similar sites for the Stork-billed Kingfisher are Kolkas, Chaurakund, Rangubeli, Semadoh, and Harisal.

The observations of this survey contributed to significant bird sightings like River Lapwing and Stork-billed Kingfisher from the Tapi River and Sipna River, which had significant results at Rangubeli, Kutanga, Chethar, Amner Fort, Semadoh, and Harisal, respectively. The Forest Owlet (Heteroglaux blewitti), a critically endangered species of Owl that was thought to be extinct for over a century, was observed at Churni Nala Chaurakund, which is ultimately part of the Sipna River. The distribution of River Lapwing (Vanellus duvaucelii) is confined to the Tapi River; it is not observed in other rivers of the Melghat landscape.

The presence of the Green Sandpiper in the riverine habitats of the Tapti and Sipna rivers indicates the significance of these water bodies as suitable environments for this particular bird species. Likewise, Malabar Pied Hornbill, Painted Stork, Black Stork, Asian Woolly-necked Stork, Eurasian Eagle Owl, Brown Fish-Owl, Great Stone Curlew, Black-headed Ibis, Glossy Ibis, European Roller, Brown Crake, etc. contributed to the scientific understanding of riverine birds in the Melghat Landscape but also provided a foundation for informed conservation actions. This study has established the framework for focused conservation measures aimed at preserving the high biodiversity of riverine habitats in the Melghat Landscape by extensively documenting the condition and variety of these birds.

Primary threats to riverine ecosystems include direct and indirect threats, such as sand mining and illegal fishing with explosive material and feral dog movements which can disrupt critical nesting and foraging sites for riverine birds. Anthropogenic activities, such as water extraction for agriculture can alter water levels, ecological parameters, and seasonal events, such as seasonal crop framing in river banks, affecting their survival and health.

CONCLUSION

The study revealed that the Melghat landscape is a unique habitat for a diverse range of riverine birds. The high diversity of 245 riverine bird species in the study area highlights the importance of the riparian zones as a crucial element of the natural system. The majority of the observed species belonged to the Ardeidae family, with the maximum number of Little Egrets, Little Cormorant, and River Tern as it is an indicator species of riverine ecosystems. These are opportunistic feeders and consume a variety of aquatic organisms, such as fish, amphibians, crustaceans, and insects. Their feeding activities can help to regulate the population of prey species and thus maintain the balance of the riverine ecosystem, which is consistent due to clean water in riverine systems.

These findings suggest that the Tapi River is a crucial habitat for these near-threatened species, River Lapwing, and its distribution is restricted to the only Tapti River, which is a large and flowing river. Such a flowing river serves as a lifeline for riperine birds. The Stork-billed Kingfisher and Black-capped Kingfisher are important in Melghat for their roles in maintaining ecological balance by controlling fish and insect populations, serving as indicators of healthy riparian ecosystems, and contributing to the region's biodiversity and ecotourism appeal.

ACKNOWLEDGEMENTS

The authors extend heartfelt gratitude to the Institute Innovation Cell, HRD and Principal Dr. G.V. Korpe, Shri Shivaji Science College, Amravati, for generous fu to the corresponding authornding and unwavering support. The authors also acknowledge the CCF, field director and staff of MTR for granting permission for this research.

Conflict of Interest: Authors declare no conflict of interest.

Data Availability: Data will be available on reasonable request, made to the corresponding author.

Join Society For Science & Nature and Avail Multiple Benefits

1. Life Members and Fellows of Society of Science & Nature (MSSN/FSSN), Bhopal, India will be entitled to receive free early on line issues of Biosc.Biotech.Res.Comm for life. They will get substantial waivers for publication of their research papers.
2. Selected life members on the basis of their academic and research contributions will be conferred with Honorary Fellowship of SSN (FSSN), who will be instrumental in scientific awareness programs, particularly encouragement and popularization of science. These members will be appointed reviewers / editors of the Journal in different subject areas. Life Fellow members of SSN will be invited to attend society sponsored conferences and seminars in India.

Instructions for Authors / Detailed MS Submission Guidelines For Bioscience Biotechnology Research Communications

All manuscripts must be submitted to Bioscience Biotechnology Research Communications
Only through the journals online submission system at https://www.bbrc.in (https://bbrc.in/homepage/submit-article-2/)

Author submitting the manuscript for the first time is required to register online and create a profile as an author. This enables the authors to receive login credentials for manuscript submission. Manuscripts must consist of duly completed Author Ethical Statement / Copyright Form along with plagiarism / similarity level Certificate of the submitted MS, (which should be less than 20%. Attach Certificate checked by Ithenticate / Turnitin Software). **This is a mandatory part of manuscript submission.**

Before final submission, please make sure that the manuscript conforms to the journal guidelines and instructions to authors for the preparation of the manuscript.

MS not prepared as per instructions to authors will not be entertained and will be returned as incomplete submission.
Please note that the journal does not charge any fees for submission of articles, and we do not give any fixed frame of time to publish an article, since the review of articles depends upon the reviewers processing time, the editorial assessment, and production. Roughly a MS takes about 60 to 90 days from the date of submission to publication, depending upon the review process and number of revisions envisaged.

1. Ethical & Plagiarism Policies of Bioscience Biotechnology Research Communications:

(Author Ethical Statement / Copyright form / Plagiarism Check Report)

Plagiarism is the unauthorized use or close imitation of the language and thoughts of another author and representing them as one's own original work and Biosc. Biotech. Res. Comm. strictly condemns all forms of plagiarism, following a very vigilant policy of removing this malady. Within the academia, it is considered dishonesty or fraud and offenders are subject to academic censure. Plagiarism can be unintentional or intentional, reproducing academic material without appropriate credit to the original authors (Citations).

Similarly self -plagiarism is the re-use of significant, identical or near identical portions of one's own work without citing the original work. This is also known as recycling fraud. Worst form of plagiarism is to steal the whole article or in parts from some source and publish it under one's own name in another journal. Plagiarism, fabrication, unethical or redundant publication grossly violates the editorial policies of Biosc Biotech Res Comm. which follows best practice guidelines given by the International Committee of Medical Journal Editors (ICMJE) and Committee on Publication Ethics (COPE), as mentioned in the Journals Instructions for Authors. Biosc. Biotech. Res. Comm. strongly condemns any form of plagiarism and unethical practices.

All authors submitting their MS to Biosc Biotech Res Comm must complete and sign the ethical statement form (downloaded from above link) and append the Plagiarism Check Certificate of their MS along with ethical statement form, failing which their MS will be not processed further.

Authors submitting their work to Biosc.Biotech.Res.Com must also mention the names, addresses and email ids of three subject experts to serve as independent reviewers for their submitted MS, in their cover letter. The reviewers must not be of their Institution, it is not necessary the same reviewers will be appointed for their submitted manuscript, selection of independent unbiased reviewers is under the purview of editorial board / editors.

The following files need to be submitted with every article:

1. Cover Letter stating the originality of research and why you think it should be published in Biosc Biotech Res Comm.
along with names / addresses and emails of 3 external reviewers must be attached,
(See Cover Letter template).
2. **Manuscript Text:** For preparation and style of MS (See Manuscript Template):

The full manuscript should contain first page with full author names, affiliation, ORCID No and the corresponding author email / ORCID details, followed by full text of the MS file in word format, not exceeding 4000 words or 20 pages. All data/tables/figures/Images (images must be submitted with the MS in high print-reproducible resolution.

2. Article Types: Submission of the following article types is considered for publication in Biosc. Biotech.Res. Comm.

1. **Original Research Articles**
2. **Critical Meta Reviews**
3. **Case Reports with Discussion**
4. **Short Communications**
5. **Letters to the Editor / Editorials / Perspectives / Correspondence**

(I) Original Research Articles
Manuscript must be written in good English, typewritten using Times New Roman font size 12 only, double-spaced with one inch margin on all sides. All manuscripts must be accompanied by author declaration with ethical certificate signed by the corresponding author and all co -authors that they have seen and approved the final version of the manuscript and that the article has NOT been published or submitted to any other journal for publication. The corresponding author is responsible for obtaining permission from the copyright owner for the use of any copyrighted material in the submitted article.
Each original article must contain the following in the order as:

Title page: Title page should contain the following information:
Main Title of the article followed by short running title, Name (s) of author(s), Department (s)/Institution(s) City / Code & Country, where the work was performed, with all author ORCID links, (https://orcid.org/login). E-mail address of the corresponding author marked with an asterisk * is necessary.

2. Abstract:

Abstract should be factual summarization of the entire work and should NOT TO EXCEED 250 words, with 5 keywords written below it.
Abstract must have following subheadings:

Introduction (Objectives / Rationale), Brief Methods, Results and Conclusion

3. Main Text of the Manuscript: Text must be arranged under the following headings:
1. Introduction
2. Material and Methods
3. Results (Including Tables/Fig/Images)
4. Discussion
5. Conclusion followed by Funding Statements /Acknowledgements (if any).
6. References (Strictly in Harvard Style)

Introduction: This section must provide a brief review of literature, purpose of the study, objectives and the rationale of the research undertaken should be given with proper clarity.

Material and Methods: This section of material and methods /procedures should be concise but detailed enough to enable the reader to reproduce the experiments / methodology. Commonly used procedures and methods in detail need not be described, but require a reference to the original source.

Results (Including Tables/Fig/Images): Give only brief findings, presented in the form of tables or figures, should be included without duplication of presentation and no discussion of the significance of the data, either tables or figures be given, avoid duplication of data.

Discussion should present the significance of the present data under the prevalent understanding and interpretation of the phenomenon. Speculative discussion is allowed but it should be concise and corroborated by the presented data.

Conclusion summarizes the study and is drawn from the results and discussion, should not be more than 100 words.

Acknowledgements/ Financial Acknowledgements if any, should be placed at the end of Conclusion before References.

6. References: (Strictly as per Harvard Style)
References in text of the manuscript should be written using last author name (s) without their initials with year in PARENTHESES ( ).

The final bibliography in the **References Section** should be **arranged alphabetically using last name of the author** and written in **Harvard Style** as shown below in examples of references: **All references must be written in 11 point font Roman letters.**

Use Italic styles only for scientific names of organisms, genera, species in the entire MS as well as in the Reference section.
In this section et al should be used only after three names of authors.

In reference section, DOIs / Links of the references from PubMed, WoS–Clarivate Analytics, Scopus, Google Scholar and others must also be provided.

All references should be checked minutely, for their appearance in text as well as in References, incomplete or missing references in the text or in Reference List & Vice versa will not be accepted, and the MS will be returned as **Incomplete Submission.**

a. Example of Reference from a Standard Journal Article:
Ali Sharique A, S Salim, Sahani T, Peter J and Ali AS (2012c) Serotinergic receptors as novel target for optimizing skin pigmentary responses in Indian bull frog, Hoplobatrachus tigerinus British Journal of Pharmacology Vol 165 No 5 Pages 1515-1525.

b. Example of Reference from a book:
Falconer DC (1960) Introduction to Quantitative Genetics. Oliver & Boyd Edinburgh 165-185.

c. Reference from article in a book:
Ali, Sharique A, N Parveen and Ayesha S Ali (2021) In Herbal Medicine: Back to The Future, Promoting Melanocyte Regeneration Using Different Plants and Their Constituents – Vol 3 (Ed. Ferid Murad, Nobel Laureate) Bentham Science, USA Pages 247-276.

Tables and Figures (or Images): Short, Precise Tables and sharp image figures must be included, complete with legends /footnotes / explanation / units should be right below them. The tables and figures pages should be consecutively numbered, and arranged between results and discussion. Position of the tables or figures in the text of the MS must be indicated using same numbers.

Instructions for Preparation of Images: An image refers to the following: Graphs, photographs, maps, charts, paintings, drawings, diagrams, etc. Images must be embedded within the manuscript text between Results and Discussion of the article, not separately or at the end of the article. Once the article is accepted for publication, the author may be asked for submission of image in high resolution file formats. It is strongly recommended before embedding images in the manuscript, images must be prepared as mentioned below in the image specifications section.

Image specifications: Images must be prepared in accordance with the instructions mentioned on the PubMed Central website: https://www.ncbi.nlm.nih.gov/pmc/pub/filespec-images/ The key factor for preparation of MS images for sufficient quality is images must have a minimum resolution of 300 dots per inch (dpi) for the grayscale (or black and white) and at least 600 dpi for color scale. The acceptable image formats are tiff, jpeg, gif, psd or png.

Image Copyright: For any image that the authors have not made themselves, the authors will need to have written permission to reproduce that image, even if the image is posted on the internet. It is the author's responsibility to obtain permission to use the images, not the publishers. Permission must be obtained in writing before the article can be submitted. For complete information, please visit the Copyright Agency Limited website: http://www.copyright.com.au/get-information/about-copyright.

(II) Critical Review Articles / Systematic Reviews / Meta-Analysis
(Simple Reviews Are not considered for publication in Biosc.Biotech.Res.Comm.)

Systematic Reviews or Meta-Analysis should be systematic, critical assessments of most recently updated literature and data sources pertaining to basic biological or bio-medical science topics that include a statistical technique for quantitatively combining the results of multiple studies that measure the same outcome into a single pooled investigation. Data must be searched for and selected systematically for inclusion and critically evaluated, and the search and selection process for compiling the review must be mentioned. The text should NOT exceed 5000 words excluding abstract, references, tables and figures.
Each of the sections of the **Systematic Review or Meta Analysis** articles should include specific sub-sections as follows:

1. Structured Abstract: (Not exceed 250 words):

Objectives, Methodology, Results and Conclusion
2. Introduction: Rationale, Objectives, Research questions
3. Methodology: Study design, Participants, interventions, comparators
4. Systematic Review Protocol: Search strategy, Data sources, Studies Sections and Data Extraction, Data analysis/ Statistical tools used
5. Results and Discussion: In results provide flow diagrams / attractive tables / figures of the studies retrieved for the review, study selection characteristics synthesized findings, risk of bias etc.

6. Summary: Abstract of main findings, Limitations, Conclusions etc.
For all other information including title page, typing and reference style etc, please follow the instructions to authors for Research Articles.

(III) Case Reports with Discussion
The case reports, of two or more patients must contain genuinely new interpretational information, discussed with up to date literature. The reports should have clinical significance, new adverse effect(s) of a drug or other unique first time observations, etc. Patient consent for publication must be obtained from the patient in written or, if this is not possible, the next of kin before submission. The author(s) must have been involved in the care of the patient.

Case Report /case description should start with a single paragraph abstract followed by text, which should not exceed 2000 words (excluding references, tables and figures) with maximum 10 bibliographic references and either three figures or three tables. Case report / case presentation must contain:

1. **Brief Abstract (should not exceed 150 words)**
2. **Introduction**
3. **Case Presentation**
4. **Reviews & Discussion**
5. **Conclusion**
6. **References**

Patient Consent, Competing interests, Funding Statement, Acknowledgements (if any). For all other information including title page, typing and reference style, please follow the instructions for original articles.

(IV) Short Communications
Short communication should be original work, such as complete results of a short pilot study, not merely a preliminary report and should not exceed 2000 words with one or two figures and/or one table. An editorial decision will be provided rapidly without reviews. For writing and references style, follow the same instructions listed above.

(V) Letters to the Editor/Editorials / Perspectives / Correspondence
Opinions on topics and articles recently published in the journal will be considered for publication if they are objective and constructive in nature and provide academic interest to the readers. These letters may also be forwarded to the author of the cited article for possible response. The editor reserves the right to shorten these letters, delete objectionable comments, make other changes, or take any other suitable decision to comply with the style and policies of the journal. For writing and references style, follow the same instructions listed above.

(VI) Editorials
Editorial will be written by one member of the editorial board as solicited by the Editor-in-Chief. The editorial is generally a scientific review on one or two of the current topics pertaining to biomedical sciences.

4. Article Processing Charges (APC) and Waivers
Bioscience Biotechnology Research Communications does not have any article submission charges, however authors will be required to pay only article processing charges (APC) that too after acceptance of their peer reviewed manuscripts.

We do not have any other charges for publication of MS in Biosc. Biotech. Res. Comm. like color print charges or reprint charges, author subscription charges or any other fees.

The moderate APC taken from authors contributes to the handling/ editorial/ production / open access/ HTML/ DOI / costs and hence is non-refundable. APC is to be deposited via Net Banking/ Electronic Transfer after acceptance of the manuscript only.

Article Processing Charges (APC) for Authors from India- Rs.7000/*
Article Processing Charges (APC) for SAARC Countries – US Dollars 175
Article Processing Charges (APC) for Low Income Countries- US Dollars 250
For All other Countries the APC is US dollars 425
*Waivers available for Non Funded Research.

Publication Fee Waivers: In order to meet the rigorous academic standards on a fast track, the open access journal has some expenses as stated above, and for these reasons we charge a very modest article processing fee. **Nevertheless, as we believe that lack of funds should not be a barrier to quality open access publication, Biosc Biotech Res Comm has a policy to provide significant waivers to deserving authors from middle and low income countries without any financial support. Authors can request for a waiver in such cases.**

5. Conditions of Acceptance of Manuscripts
Acceptance of Manuscript: On acceptance, the editors retain the right to make stylistic changes in the MS, shorten the material as necessary and decide on the date and periodicity of publication.

6. Galley Proofs: Authors will be sent an online copy of the galley proofs to the email id of only the corresponding author. Corrections should be confined to typographical errors or matters of accuracy. Authors should return their galley proofs within two days of receipt. If there is a delay in

returning the proofs beyond the given deadlines the MS will be published in next issue, no changes in the MS will be possible once the author sends the corrected galleys.

7. Early On Line Ahead of Print Publication / Final Publication

Early on Line E- Prints, ahead of final publication, is provided by Bios Biotech Res Comm to enable authors and readers to have early and free access to their published work.

8. Checklist for Authors While Submitting Their Manuscripts

- **As part of the on-line submission process, authors should carefully check their submission, using the below Check List for careful compliance with the following items as the manuscript will be returned to the authors as Incomplete Submission if any of the following points is missing.**
- The main manuscript has been prepared by all the concerned authors, after carefully reading all the Instructions to Authors.
- All authors through the corresponding or principal author have filled and enclosed the Author Ethical Statement, Copy Right and Plagiarism-Check Certificate along with their manuscript.
- **The above forms of Author Ethical Statement, Copy Right and Plagiarism-Check Certificate should be downloaded from journals website www.bbrc.in and must be filled, signed by all authors and attached with the MS.**
- The submission file format is in ˜Microsoft Word document file and not a PDF.
- The text is double-spaced and should be within the word limit of 4000 words or 20 pages with a 12-point Roman font
- Italics must be used only for all scientific / Latin / Greek names.
- **A single manuscript word file has been submitted that contains title page, short running title, author details, abstract followed by main manuscript.**
- **Check all correct authors names, their addresses, email ID of corresponding author and ORCID link of all authors.**
- **A brief cover letter stating why the submission is suitable for Bios Biotech Res Comm must be attached mandatorily giving names,**
- **Addresses and e-mail ids of 3 subject experts to serve as unbiased reviewers, who should be from different universities and institutions.**
- Main MS file must be in word format, single and must contain all text matter headings such as Title, Short Running Title, Abstract, MS Main Text Matter Tables / Figures / and References in it.
- Abstract of 250 words must be written under headings: **Background / Introduction, Objectives and Rationale, Brief Methods, Results and Conclusion.**
- Mention 5 key words below the abstract in alphabetical order
- Only 5 subheadings are required in the main MS: **Introduction, Material and Methods, Results & Discussion, Conclusion and References.**
- Ethical approvals / consent to participate must come in Methodology. Acknowledgements / funding details (if any) must come after Conclusion before References.
- All illustrations, figures, and tables are properly numbered and should be arranged between Results & Discussion.
- Size of tables / figures must not be more than half a page. All legends of tables / figures must be written right below them.
- **References should be written in text with AUTHOR LAST NAME WITH YEAR IN PARENTHESES ( )**
- **Strictly as per Harvard Style of References. Do not use any italics for names of Journals or their Volumes Numbers or years**
- **All references in the References Section must be alphabetically arranged using only the first author's last name as per Harvard style.**
- **Use of et al in Reference Section must only be used after writing three author names.**
- Name, designation, institution and email address of three independent reviewers related to the

Subject area of research must be provided in the cover letter along with the manuscript.

Journal's Address:

Head Office: Editor in Chief
Bioscience Biotechnology
Research Communications,
Post Box No 01 GPO Bhopal 462001 India
